---

## HARDWARE USER MANUAL

Visit our website at [www.dpstelecom.com](http://www.dpstelecom.com) for the latest PDF manual and FAQs.

## Revision History

---

November 13, 2019	Updated Power Connection section
January 4, 2018	Note about Discrete alarms added to Specs
December 20, 2017	Added Build Options for Dual NIC and SFP Fiber Port
December 11, 2015	DNP - Update
October 27, 2015	Display mapping updates
Septemeber 8, 2015	DNP - Update
August 4, 2015	DNP - Points list
May 12, 2015	DNP - DWire Updates
January 26, 2015	Added DNP3 Section
January 28, 2014	Changed SSH screenshot and verbage
January 10, 2014	Edited TTY and SSH login information
December 3, 2013	Removed PPP Configuration
October 28, 2013	Added CellGuard Option
June 13, 2013	Added SCAN protocol support
April 9, 2013	Added D-Wire support
March 27, 2013	Added SSH via PuTTY Information
June 25, 2012	Added Hinged Pluggable Back Panel and Switch TestBox to Optional Accessories
June 19, 2012	Updated new web interface and build options. Division of Hardware and Web into separate manuals - FW version 1.1A and after
March 2, 2012	Edited relay information
March 9, 2011	Included Web Interface section
March 3, 2011	Included information about the wire wrap attachment option
September 21, 2010	Updated Shipping and Accessories Lists
August 19, 2010	Misc. user manual edits.

# 1 NetGuardian 420 Overview

*The NetGuardian has all the tools you need to manage your remote site.*

## **The NetGuardian 420 — The Intelligent RTU for Complete Site Management**

The NetGuardian 420 is a RoHS 5/6-compliant, LAN-based, SNMP/DCPx remote telemetry unit. The NetGuardian has all the tools you need to manage your remote sites, including built-in alarm monitoring, paging and email capabilities that can eliminate the need for an alarm master.

### ***With the NetGuardian, you can:***

- Monitor 20 discrete alarms, 32 ping alarms, and up to 6 analog alarms
- Control remote site equipment via 4 terminal server ports and up to 4 control relays
- Monitor your remote site from anywhere using the NetGuardian's built-in Web Browser Interface.
- Report alarms to multiple SNMP managers or the T/Mon NOC Alarm Monitoring System.
- Report alarms via LAN or dial-up connection.
- Automatically send pager and email alarm notifications 24/7.
- Connect multiple concurrent users via Telnet over LAN to telecom switches, servers, radios, PBXs and other equipment.
- Monitor discrete and analog threshold alarms.
- Ping IP network devices and verify that they're online and operating.

**New:** The NetGuardian 420 supports serial baud rates up to 115,200, **optional** external temperature sensor, analog readings accurate to within +/- 1%, one 10/100 NICs (isolated), SNMPv2c, SNMPv2c Inform trap, and SNMPv3.

### **Stand-alone local visibility**

You don't need an alarm master unit to monitor your site with the NetGuardian. With the NetGuardian's built-in Web Browser Interface, you can access the NetGuardian, view alarms and control remote site devices from any computer anywhere in your network.

### **24/7 pager and email alerts - no master needed**

Out of the box, the NetGuardian supports 24/7 pager and email reporting. Send alarms directly to maintenance technicians in the field, even when no one's in the office.

### **Connect via LAN to telecom switches, servers, radios and more**

Each of the NetGuardian's eight serial ports can be individually configured to serve as a craft port, a channel port or a TCP or UDP reach-through port, giving you LAN-based terminal server access to up to 4 serial devices.

### **NEW - RADIUS Authentication**

Take the security of your alarm remotes to the next level with RADIUS authentication. Now the NetGuardian 420 can interact with your RADIUS server, integrating it as part of your enterprise management.

### **Reports to multiple SNMP managers and T/Mon NOC simultaneously**

The NetGuardian reports to both the T/Mon NOC Alarm Monitoring System and any SNMP manager. You can simultaneously forward alarms from the NetGuardian to T/Mon NOC and multiple SNMP managers at multiple IP addresses. Alarms can also be configured to dispatch to one, some, or all SNMP managers.

## 2 Shipping List

While unpacking the NetGuardian, please make sure that all of the following items are included. If some parts are missing, or if you ever need to order new parts, please refer to the part numbers listed and call DPS Telecom at (800) 622-3314.

**NetGuardian 420: D-PK-NG420**

**NetGuardian 420 Hardware Manual D-UM-NG420**

**NetGuardian 420 Resource CD (includes manuals, MIBs, and software)**

**DB9M-DB9F Download Cable 6 ft. D-PR-045-10-A-04**

**One Ethernet Cables 14 ft. D-PR-923-10A-14**

x2

**23" Rack Ears D-CS-325-10A-01**

x2

**19" Rack Ears D-CS-325-10A-00**

x4

**Four Metric Rack Screws 2-000-80750-03**

x8

**Eight 3/8" Ear Screws 1-000-60375-05**

x4

**Four Standard Rack Screws 1-000-12500-06**

**Power Connector Plugs for Main Power Fuses 2-820-35102-00**

x3

**Three 3/4-Amp GMT Main Power 2-741-00750-00**

x2

## Two Cable Ties

## Pads

2-015-00030-00

Screws and connectors are packaged in a sealed hardware kit, shown above

(Hardware kit containing a WAGO connector)

## 3 Optional Accessories

Telephone Cable 6 ft.  
(Optional, if ordering modem)  
D-PR-045-10A-01

4 Pin Analog Connector  
(optional, for analogs)  
2-820-00814-02

External Temperature Sensor  
D-PR-1870-10A-07

Wire Wrap Back Panel  
D-PK-WWADP-12003.00001

NetGuardian SiteMON IP G2

D-PK-CAMRA

The NetGuardian SiteCAM provides streaming video security surveillance of remote sites. The SiteCAM connects to either the NetGuardian's integrated 10/100BaseT switch or a separate 10/100/1000 switch. SiteCAM video can be accessed directly from the NetGuardian's Web Browser Interface. Up to four cameras can be supported.

## 4 Specifications

<b>Discrete Alarm Inputs:</b>	20 (2 Groups: 1-16, 17-20. Each group can be configured as either power inputs or TTL)
<b>Analog Alarms:</b>	Up to 6 (2 user defined / 1 Internal temp / 1 External temp / 2 Voltage)
	<b>Analog Input Range:</b> (–94 to 94 VDC or 4 to 20 mA)
<b>Control Relays:</b>	4 (2 Form A and 2 Form C)
	<b>Maximum Voltage:</b> 60 VDC/120 VAC
	<b>Maximum Current:</b> 1 Amp, AC/DC
<b>Ping Alarms:</b>	32
<b>Protocols:</b>	SNMPv1, SNMPv2c, SNMPv3, DCPx, DCPf, TRIP, SNPP SMTP, TAP, HTTP, FTP, TELNET, ICMP, RADIUS
<b>Interfaces:</b>	4 RJ45 Yost serial ports 1 RJ45 10/100 Ethernet ports 1 RJ11 telco jack (optional for modem) 1 50-pin amphenol connectors (discrettes, controls, and analogs) 1 4-pin screw connector (analog)
<b>Dimensions:</b>	1.75"H x 17"W x 7.5"D
<b>Mounting:</b>	19" or 23" rack
<b>Weight:</b>	3.5 lbs
<b>Power Input:</b>	–48VDC (–36 to –72 VDC) (Optional) –24 VDC (–18 to –36 VDC) (Optional) Wide Range –24/–48 VDC ( –18 to –58 VDC) (Optional) +24VDC (+18 to +36VDC)
<b>Power Output:</b>	(Optional) +12 VDC or +24 VDC power output for external sensor
<b>Current Draw:</b>	500 mA at 48VDC
<b>Fuse:</b>	3/4 amp GMT for power inputs
<b>Modem:</b>	33.6 K internal (optional)
<b>Visual Interface:</b>	LCD display 9 bicolor LEDs 5 unicolor LEDs
<b>Audible Notification:</b>	Alarm speaker
<b>Operating Temperature:</b>	32°–140° F (0°–60° C)
<b>Operating Humidity:</b>	0%–95% noncondensing
<b>Build Options:</b>	Real-time clock, HTTPS (Secure web browsing), Serial port options: RS232, RS485, or 202 modem
<b>MTBF:</b>	60 years
<b>Windows Compatibility:</b>	Windows 95, 98 NT, ME, XP, 2000, Vista, 7 32/64 bit
<b>RoHS:</b>	5/6

## 5 Hardware Installation

### 5.1 Tools Needed

To install the NetGuardian, you'll need the following tools:

**Phillips No. 2 Screwdriver**

**Small Standard No. 2 Screwdriver**

**Wire Strippers/Cutter**

**Wire Wrap Gun (if hinged wire wrap panel is used)**

**Punch Down Tool (if 66 blocks are used)**

**PC with terminal-emulating software  
(i.e. HyperTerminal)**

### 5.2 Mounting

*The NetGuardian can be flush or rear-mounted*

The NetGuardian mounts in a 19" rack or a 23" rack using the provided rack ears for each size. Two rack ear locations are provided. Attach the appropriate rack ears in the flush-mount or rear-mount locations shown in Figure 6.2.1.

**Note:** Rack ears can be rotated 90° for wall mounting or 180° for other mounting options (not shown).

## 5.3 Power Connection

*Power connectors and fuses.*

The NetGuardian has two screw terminal barrier plug power connectors, located on the left side of the back panel.

**The Grounding Lug on the back of the unit provides a permanent connection to earth ground when connected. The Grounding Lug must be used in order to comply with standards.**

**If the unit is not ground isolated the power input terminal labeled "GND" is electrically the same as the ground lug. For negative input voltages this means that the ground lug (and the chassis) is positively charged in reference to the power input terminal labeled "-BATT" or "-48". Placing a (non-GND Isolated) NetGuardian on a rack that shares ground with a +48 power supply will short the (+) Positive output of the power supply to ground, since the (+) would connect to ground.**

**Before you connect a power supply to the NetGuardian, test the voltage of your power supply:**

- Connect the black common lead of a voltmeter to the ground terminal of the battery, and connect the red lead of the voltmeter to the battery's  $-48$  VDC terminal. The voltmeter should read **between  $-43$  and  $-53$  VDC**. If the reading is outside this range, test the power supply.

**To connect the NetGuardian to a power supply, follow these steps:**

1. Remove the fuse from the back panel of the NetGuardian. **Do not reinsert the fuse until all connections to the unit have been made.**
2. Remove the power connector plug from Power Connector A. Note that the plug can be inserted into the power connector only one way — this ensures that the barrier plug can only be reinserted with the correct polarity. Note that the  **$-48$  V terminal is on the left** and the **GND terminal is on the right**.
3. Use the grounding lug to connect the unit to earth ground. The grounding lug is next to the  symbol. Insert the eyelet of the earth ground cable between the two bolts on the grounding lug (Ground cable not included).
4. Insert a **battery ground** into the power connector plug's **right terminal** and tighten the screw; then insert a  **$-48$  VDC** line to the plug's **left terminal** and tighten its screw.
5. Push the power connector plug firmly back into the power connector. If the power feed is connected correctly, the LED by the connector will light **GREEN**. If the polarity of the power feed is reversed, the LED will not illuminate.
6. Repeat Steps 2–4 for Power Connector B.

7. Reinsert the fuse to power the NetGuardian. The front panel LEDs will flash **RED** and **GREEN**.

## 5.4 LAN Connection

### RJ45 Ethernet Connection

The NetGuardian 420 has one 10/100 Ethernet port. If the IP connection is OK, the LNK LED will light **SOLID GREEN** when the cable is connected.

### Build Option: Net1/Net2 (Dual NIC)

For enhanced security, the NetGuardian 420 can be ordered with a second LAN connection and optional 4-port switch (Net2). When ordered this way, both Net1 and Net2 have separate IP addresses and subnet mask, so you can safely connect one port to your private company LAN and the other to the public Internet.

There is no routing between Net1 and Net2, this ensures that both connections are independent of each other. By default, outbound data traffic from the NetGuardian will be sent over Net2. Only outbound data that is specifically directed to Net1, usually the Company's LAN, will be sent to Net1. To use both network interfaces, be sure Net1 and Net2 are on separate Subnet Masks.

To use only one of the network interfaces, set either Net1 or Net2 to IP address being used and set the unused network IP subnet and gateway to 255.255.255.0. Both ports are standard RJ45 ports that take standard RJ45 Ethernet cables. If the IP connection is OK, the LNK LED will light **SOLID GREEN** when the cable is connected.

### Build Option: 100Base-FX SFP Fiber Port on Net2

Your NetGuardian 420 can also be ordered with a 100Base-FX SFP Fiber Port on Net2 (instead of standard LAN). The SFP ports are internally connected to the 4 port switch and Net2 meaning if this option is populated, port 4 is inactive on the switch.

**The NetGuardian 420 with Dual NIC and 100Base-FX SFP Fiber Port options populated**

## 5.5 Telco Connection

*Telco jack*

The rear panel telco jack connects the NetGuardian's internal 33.6 modem to a standard phone line for dial-up access and pager alarm notification.

### RJ11 Phone Line Connection

Pinout for the Telco jack

## 5.6 Alarm and Control Relay Connections

*Alarm and control relay connectors (\*Optional Analog Connector Shown)*

The NetGuardian 420's discrete alarm inputs, control relay outputs are connected through the 50-pin connectors labeled "Discret 1-20 / Relays 1-4" on the back panel. Analog alarm inputs 1 and 2 are connected through the four-pin analog connector.

**Note:** Analog alarms are a build option for the NetGuardian 420. Your NetGuardian 420 may not have analog inputs.

### 5.6.1 Alarm and Control Relay Connector Pinout Table

Discret 1-25					
	RTN	ALM		RTN	ALM
<b>ALM 1</b>	1	26	<b>ALM 13</b>	13	38
<b>ALM 2</b>	2	27	<b>ALM 14</b>	14	39
<b>ALM 3</b>	3	28	<b>ALM 15</b>	15	40
<b>ALM 4</b>	4	29	<b>ALM 16</b>	16	41
<b>ALM 5</b>	5	30	<b>ALM 17</b>	17	42
<b>ALM 6</b>	6	31	<b>ALM 18</b>	18	43
<b>ALM 7</b>	7	32	<b>ALM 19</b>	19	44
<b>ALM 8</b>	8	33	<b>ALM 20</b>	20	45
<b>ALM 9</b>	9	34			
<b>ALM 10</b>	10	35			
<b>ALM 11</b>	11	36			
<b>ALM 12</b>	12	37			

Control Relays 1-4			
	NO	NC	CO
<b>CTRL 1</b>	21	46	47
<b>CTRL 2</b>	23	48	22
<b>*CTRL 3</b>	49	49	24
<b>*CTRL 4</b>	50	50	25

Analog 1-2		
ADC	-	+
<b>1</b>	1-	1+
<b>2</b>	2-	2+

*Alarm and control relay connector pinout for the 420*

Above, you'll see pinouts for the 50-pin connector "Discret 1-20 / Relays 1-4," and the pinout for the four-pin connector "Analog 1-2."

\*You can set your NetGuardian's control relays 3 and 4 for either Normally Open or Normally Closed operation via a jumper on the NetGuardian PC board. By default, relays 3 and 4 are configured for Normally Open operation. For more information, see the **Controls** section of this manual.

## 5.6.2 Discrete Inputs/Control Relay Pinout

*Pinout of the NetGuardian Amphenol labeled "Discretes 1-20/Relays 1-4"*

**Note:** CT3SW and CT4SW indicate relays 3 and 4, which are hardware configurable (switched) for Normally Open or Normally Closed operation via jumpers on the NetGuardian PC Board. By default, relays 3 and 4 are set for Normally Open operation.

### 5.6.3 Optional Wire Wrap Back Panel

*The Wire Wrap attachment for the NetGuardian 420*

The optional wire wrap attachment provides wire-wrap connections for the NetGuardian 420's alarms and control relays. To connect alarms and relays to the back panel:

1. Connect the panel directly to the unit's rear amphenol.
2. Connect discretes and control relays to the appropriate pins.

*Pinout for the Wire Wrap Discrete Alarms*

*Pinout for Wire Wrap Control Relays*

## 5.6.4 Integrated Temperature and Battery Sensor (Optional)

*The external temperature sensor*

The optional integrated temperature and battery sensor monitors the ambient temperature and the NetGuardian's power inputs. This option is available only if it was ordered with your NetGuardian. The integrated temperature sensor measures a range of 32° F to 140° F (0° C to 60° C) within an accuracy of  $\pm 1^\circ$ .

Sensor Function	Analog Input Options
Temperature	Can be used on analog input 7 (Internal)
Power Feed A	Can be used on analog input 5
Power Feed B	Can be used on analog input 6
Temperature	Can be used on analog input 8 (External)

*Integrated sensor connection options*

Each integrated sensor takes the place of an analog input, and does not need any external connections. No other analog input can be connected to the input point used for the integrated sensors. The table above lists the connection options for the integrated temperature sensor. Note that these options are set at the factory, based on the option ordered, and cannot be adjusted by the user.

For more information on configuring your analogs using the web interface, see the section titled, "Configuring Analogs" in the "Web Interface" section of this manual.

## 5.7 Discrete Alarms

Dry Contact

Contact to Ground

Note: Make sure that grounds have a common reference—this is usually done by tying grounds together.

*Discrete alarm points can connect as a dry contact or a contact to ground*

The NetGuardian 420 features up to 20 discrete alarm inputs — also called "digital inputs" or "contact closures". Discrete alarms are either active or inactive, so they're typically used to monitor on/off conditions like power outages, equipment failures, door alarms and so on.

The NetGuardian's discrete alarm points are single-lead signals referenced to ground. The ground side of each alarm point is internally wired to ground, so alarm points can connect either as a dry contact or a contact to ground.

**In a dry contact alarm:** The alarm lead brings a contact to the ground lead, activating the alarm.

**In a contact to ground alarm:** A single wire brings a contact to an external ground, activating the alarm.

You can reverse the polarity of each individual discrete alarm point, so that the alarm is activated when the contact is open. This is done with a software configuration change.

## 5.8 Data Ports

The NetGuardian's 4 terminal server ports provide reach-through terminal server functionality for connecting multiple simultaneous users to external equipment via Telnet over LAN. Each port can function as a proxy connection to an external device, a craft port, a channel port, a TCP or UDP reach-through port. The NetGuardian can support simultaneous proxy connections for up to 4 users.

Yost RS-232 RJ45 Connector

Yost RS-485 RJ45 Connector

Yost 4-Wire 202 Connector

*Data port pinouts*

NetGuardian data ports can be configured for Yost RS-232 or RS-485. These data ports are available as optional builds on NetGuardian hardware units (Call DPS Sales for more information @ 1-800-693-0351).

Pin #	Signal	Description
1		Not connected
2	<b>TX</b>	<b>Transmit data</b>
3	<b>RX</b>	<b>Recieve Data</b>
4		Not connected

*DB9 RS-232 Pinouts (Craft Port Only)*

## 5.9 Optional 66 Block Connector

The 50-pin connectors on the back panel of the NetGuardian can be connected to the optional 25-pair 66 Block Connector (part number D-PR-966-10A-00).

**Note:** If connecting to a 50-pair split block, all connections should be made on the two pin columns closest to the right-hand side of the block or bridge clips should be installed.

	Wire color (wire/strip)	Connection	66 Block Pair #	Corresponding 50-Pin Connector Pin #
	WHT/BLU	ALM 1	1	26

*Optional 66 block pinout for Discretes 1–20*

## 5.10 Controls

*Adjustable jumpers on the NetGuardian 16A circuit board*

Control Relays 3 and 4 on your NetGuardian are configured for Normally Open or Normally Closed (NO/NC) operation via jumpers on the NetGuardian's PC board.

By default, relays 3 and 4 are set for Normally Open (NO) operation.

To access your control relay jumpers, remove the top of the NetGuardian chassis. Start by removing the top 3 screws on the unit, then the bottom 3 screws. Remove the front 2 screws on the craft port and remove the lid.

**WARNING:** Always observe anti-static precautions whenever accessing your NetGuardian's PC Board

*Jumper settings for analog alarm inputs and control relays*

Reference the jumper settings in the image above to correctly configure Control Relays 3 and 4.

**Note:** Default control relay operation may differ depending on your NetGuardian's build options.

## 6 LCD Display

*NetGuardian Front Panel LCD*

The front panel LCD displays the current alarm and control status and provides a command menu for controlling the NetGuardian's basic functions.

### Using the LCD command menu

The four buttons surrounding the front panel LCD are used to access the LCD Command Menu. To access the menu, press the Menu button. To scroll the menu, use the ▼ and ▲ buttons. To select a menu command, press the Sel (Select) button.

### Standard Prompt

When no Command Menu item is selected and no alarms or relays are active, the LCD displays the firmware version and the standard prompt, `Press MENU for front panel options.`

### Controlling Display Speed

The scroll speed can be temporarily increased by pressing and holding the ▲ button while the message is active.

## 6.1 Alarm and Control Status Messages

If an alarm or control relay is active, the LCD will display the following messages to indicate alarm and control status. The LCD panel will display the following messages to indicate alarm and control status:

- |                         |                                                                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Discrete Alarms:</i> | If there are any standing discrete alarms, the display will read "Discrete Alarms:", followed by the user-defined descriptions of the standing alarm points.                                                                                                 |
| <i>Relays:</i>          | If there are any latched relays, the display will read "Relays:", followed by the user-defined descriptions of the latched relays.                                                                                                                           |
| <i>Ping Alarms:</i>     | If any ping targets have failed to respond within the specified time, the display will read "Ping Alarms:", followed by the user-defined descriptions of the ping targets.                                                                                   |
| <i>Analogs:</i>         | If any analog channels have crossed a threshold value, the display will read "Analogs", followed by the user-defined description of the analog channel, the channel's last voltage reading, and a letter indicating which threshold the channel has crossed. |

Analog thresholds are represented by the following characters:

- |              |                       |
|--------------|-----------------------|
| Major Over:  | a capital <b>O</b>    |
| Minor Over:  | a lower-case <b>o</b> |
| Minor Under: | a lower-case <b>u</b> |
| Major Under: | a capital <b>U</b>    |

## New LCD Function - "Point Mode"

This new feature allows you to change the way active alarms are displayed on the NetGuardian's front panel LCD screen. When the LCD is in "Point Mode," only the display points in alarm are displayed on the screen, instead of the full alarm descriptions. Point numbers for discrete alarms, analog threshold crossings, and latched relays will appear on the LCD. "Point Mode" is configurable from the TTY command line interface or the Web Interface

*The following windows are supported and are processed in this order:*

1. Base Alarms
2. Expansion 1 Alarms
3. Expansion 2 Alarms
4. Expansion 3 Alarms
5. Ping Alarms
6. Base Relays
7. Expansion 1 Relays
8. Expansion 2 Relays
9. Expansion 3 Relays
10. Base Analogs
11. Expansion 1 Analogs
12. Expansion 2 Analogs
13. Expansion 3 Analogs
14. Network Link Down

Only windows with alarms will appear on the LCD. If no alarms are active, a "no alarms active" message will appear. The LCD Delay Time is how long you want the points to show on the screen. You can set the delay time from 1-60 sec (default is 2 sec.) This is configurable from the TTY command line interface or the web interface.

### Using the Front Panel LCD buttons for Point Mode

Pressing the SEL, ▲, or ▼ buttons will force the NetGuardian back into Scroll Mode for 3 minutes. This is particularly useful for viewing the configured descriptions or analog values associated with the active alarms. When Point Mode is enabled, but you chose to go into Scroll Mode, press the MENU button twice to go back.

See section "New! TTY Command Mode" for instructions on enabling / disabling Point Mode.

## 6.2 LCD Command Menu

*LCD display*

The LCD Command Menu provides commands for controlling some of the NetGuardian's basic functions: temporarily silencing the alarm speaker, rebooting the unit, and running the TTY configuration utility.

When no Command Menu item is selected and no alarms or relays are active, the LCD displays the firmware version and the Standard Prompt, **Press MENU for front panel options**. (See Figure 7.3.1, above.) To access the Command Menu, press the Menu button.

### 6.2.1 Sound off

*Sound Off command*

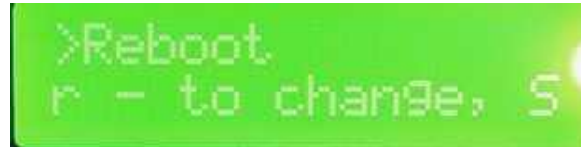

### Sound off

The Sound off command suppresses sounds from the alarm speaker for a user-defined period of 10, 20, or 30 minutes. **To scroll to the next menu command**, press the ▼ button.

**To change the Sound off setting**, press Sel to select the command. The arrow cursor (>) will move to the right of the colon (:) in **Sound off:** to indicate that the command submenu is selected. Press the ▼ and ▲ buttons to scroll through the Sound off time period options. Select 0 minutes to allow all sounds. When the time period you want is displayed, press Sel to make your selection. **To exit the Command Menu** without changing the Sound off setting, press Menu.

## 6.2.2 Reboot

*Reboot command*

### Reboot

The Reboot command reboots the NetGuardian. Press Sel. The LCD will briefly display the message **Rebooting . . .**, and the normal boot sequence will begin. **To exit the Command Menu** without rebooting, press Menu.

## 6.2.3 Run Config

*Run Config command*

### Run Config

The Run Config command forces the TTY configuration interface to run over the craft port at the user defined baud rate (default is 9600 baud).

**To run the TTY configuration utility**, press Sel. **To exit the Command Menu** without running the TTY interface, press Menu.

## 6.2.4 Contrast

*Contrast command*

### Contrast

The **Contrast** command provides controls for adjusting the contrast of the LCD.

**To adjust the contrast**, press Sel to select the command. The arrow cursor (>) will move to the right of the colon (:) in **Contrast:** to indicate that the command submenu is selected. Press the ▼ or ▲ button until you're

satisfied with the contrast setting, then press Sel to make your selection. **To exit** the Command Menu and **revert to the default contrast setting**, press Menu.

## 7 Alarm Speaker

The NetGuardian's alarm speaker emits distinctive tones under two conditions

1. **If there is an Ethernet connection failure**, the speaker will emit a intermittent beep. Press any front panel button to silence the speaker.
2. **If an alarm occurs**, the speaker will emit an **intermittent beep**. Press any front panel button to silence the speaker. If you do not silence the speaker, the beep will continue for the user defined duration (default is a 6 second duration). Silencing the speaker will allow the next alarm, if any, to sound.

## 8 Front Panel LEDs

*Front panel LEDs*

The NetGuardian's front panel LEDs indicate communication and alarm reporting status. LED status messages are described below.

LED	Status	Description
Alarm	Blink Red	New COS alarm*
	Solid Red	One or more standing alarms*
Config	Blink Green	Valid Configuration
	Blink Red	Invalid Configuration
Craft	Blink Green	Transmit over craft port
	Blink Red	Receive over craft port
Data Ports1-4	Blink Green	Transmit over indicated data port
	Blink Red	Receive over indicated data port
Hardware Acceleration	Blink Green	Hardware functioning properly.

**\*NOTE:** Alarm must be configured for notification to be reflected in LED

*Front panel LED Status message descriptions*

## 9 Back Panel LEDs

*Back panel LEDs for Power (left) and Ethernet connections*

The back panel LEDs indicate the status of power and Ethernet connections. LED status messages are described below in Table 10.A.

LED	Status	Description
Power A and/or B	Solid Green	Polarity is correct on power feed A or B.
	Off	No Power or Polarity Reverse
FA	Solid Red	Fuse failure
Net1	Blink Green	Activity over indicated integrated Ethernet port
Net2 (Ordering Option)	Blink Green	Activity over indicated integrated Ethernet port
1,2,3,4/SFP (Ordering Option)	Blink Green	Activity over indicated integrated port <b>NOTE:</b> If Net2 was ordered without SFP, LEDs will read 1,2,3,4. If SFP option populated, 4 will be replaced with SFP.

*Back panel LED Status message descriptions*

## 10 Configuring the NetGuardian

The NetGuardian must be provisioned with log-on passwords, alarm descriptions, port parameters, ping targets, control descriptions, and other system information. Most provisioning will be done via the NetGuardian Web Interface. The NetGuardian also supports a limited TTY interface (used mostly for initial unit configuration.)

You can provision the NetGuardian IP Address either locally through the craft port or remotely through a LAN connection. However, to access the NetGuardian via LAN you must first make a temporary connection to the NetGuardian and assign it an IP address on your network. For more information, see the following section, "Connecting to the NetGuardian."

### 10.1 RADIUS Authentication

RADIUS authentication is now supported by any NetGuardian 420 platform.

RADIUS (Remote Authentication Dial In User Service) is an industry-standard way to manage logins to many different types of equipment in one central location. The NetGuardian connects to your central RADIUS server. Every time a device receives a login attempt (usually a username & password), it requests an authentication from the RADIUS server. If the username & password combination is found in the server's database, an affirmative "access granted" reply is sent back to the unit device, allowing the user to connect.

Also included in the reply are the user's individual access rights, so different users can be granted different privilege levels. If the user's login attempt is not found, a rejection is returned instead. RADIUS configuration for

---

the NetGuardian will be achieved via the web browser interface or TTY interface. For details, see the separate user manuals for the NetGuardian 420 web browser.

# 11 Connecting to the NetGuardian

## 11.1 ... via Craft Port

*NetGuardian Craft Port*

The simplest way to connect to the NetGuardian is over a physical cable connection between your PC's COM port and the NetGuardian's craft port.

Use the DB9M-DB9F download cable provided with your NetGuardian to make a craft port connection.

**Select the following COM port options:**

- Bits per second: **9600**
- Data bits: **8**
- Parity: **None**
- Stop bits: **1**
- Flow control: **None**

The default password is 'dpstelecom'

You can perform basic configuration via the craft port — but if you like, you can connect via the craft port just to configure the NetGuardian's Private LAN IP address, and then do the rest of your configuration via a LAN connection.

## 11.2 ... via LAN

**Ethernet port 1**

You can also connect to the NetGuardian over a LAN connection. This is a very convenient way to provision multiple NetGuardian units at multiple locations.

**To connect to the NetGuardian via LAN, all you need is the unit's IP address (Default IP address is 192.168.1.100).**

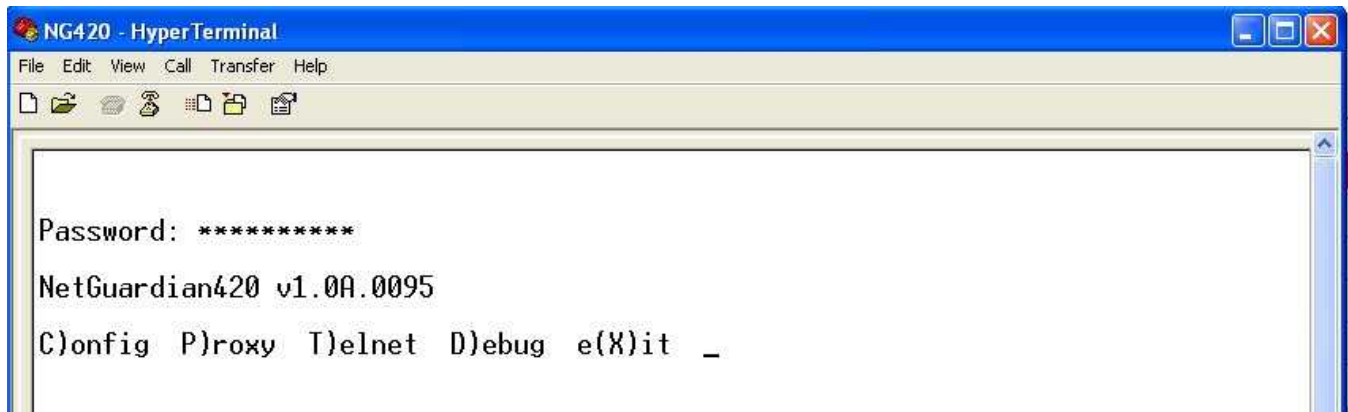

**Note:** NET is defaulted to 192.168.1.100

**If you have physical access to the NetGuardian**, the easiest thing to do is connect to the unit through the craft port and then assign it an IP address. Then you can complete the rest of the unit configuration over a remote LAN connection, if you want. For instructions, see Section 12.1, "Connecting to the NetGuardian via Craft Port."

**If you DON'T have physical access to the NetGuardian**, you can make a LAN connection to the unit by temporarily changing your PC's IP address and subnet mask to match the NetGuardian's factory default IP settings. Follow these steps:

1. Look up your PC's current IP address and subnet mask, and write this information down.
2. Reset your PC's IP address to **192.168.1.200**.
3. Reset your PC's subnet mask to **255.255.0.0**. You may have to reboot your PC to apply your changes.
4. Once the IP address and subnet mask of your computer coincide with the NetGuardian's, you can access the NetGuardian via a Telnet session or via Web browser by using the NetGuardian's default IP address of **192.168.1.100**.
5. Provision the NetGuardian with the appropriate information, then change your computer's IP address and subnet mask back to their original settings.

## 12 TTY Interface

*The TTY interface initial configuration screen*

The TTY interface is the NetGuardian's built-in provision controls for basic configuration of the NetGuardian. Configure the NetGuardian's ethernet port settings, monitor the status of base and system alarms, operate control relays, view live ping targets, view debug or create proxy connections to other ports.

To use the TTY interface with the NetGuardian, all you need is any PC with terminal emulation software (i.e. Hyperterminal) and a connection to the NetGuardian. This connection can be a direct connection to the NetGuardian's front panel craft port or a remote connection via Telnet or dial-up.

Some initial software configuration must be performed before you can use a remote connection to the NetGuardian. For Telnet, connect to the NetGuardian's IP address at port 2002 to access the configuration menus after initial LAN/WAN setup. **Telnet sessions are established at port 2002, not the standard Telnet port** as an added security measure.

The TTY interface is primarily used for configuring and provisioning the NetGuardian, but you can also use it to ping IP targets, view system statistics, and data port activity.

**NOTE:** The TTY default password is "dpstelecom".

### Menu Shortcut Keys

The letters before or enclosed in parentheses ( ) are menu shortcut keys. Press the shortcut key to access that option. Pressing the ESC key will always bring you back to the previous level. Entries are not case sensitive.

## 12.1 Unit Configuration

### 12.1.1 Ethernet Port Setup

The NetGuardian must be assigned an IP address before you will be able to connect via LAN/WAN using a Telnet client or a Web browser. To connect via LAN, the minimum configuration requires setup of the IP address and subnet mask. Minimum WAN configuration requires that the default gateway be set as well. Follow the instructions below to configure the NetGuardian's IP address, subnet mask, default gateway, trap address, SNMP port number, proxy base, and DHCP option.

```

NG420 - HyperTerminal
File Edit View Call Transfer Help

Password: *****
NetGuardian420 v1.0A.0095
C)onfig P)roxy T)elnet D)ebug e(X)it

E)thernet n(V)ram P)PP D)ate/time R(A)DIUS R)ebboot (ESC) ? E
G)lobal N)ET (ESC) ? N

Net 1 Interface

Unit Address   : 126.010.230.132 (126.010.230.132)
Subnet Mask    : 255.255.192.000 (255.255.192.000)
Default Gateway : 255.255.255.255 (000.000.000.000)
Link Status    : Detected

MAC Address    : 00.10.81.00.41.D3

(U)nit Address S)ubnet Mask G)ateway (ESC) ?

```

*Configure the Ethernet port parameters*

1. Connect using Hyperterminal @ 9600, 8, N, 1.

2. Hit enter (you won't be able to see this text), the NetGuardian will respond with "Password."  
Note: If you receive no password prompt then check the port you are using on your PC and make sure you are using a straight thru cable.
3. Type the default password, "dpstelecom," then press Enter.  
Note: DPS strongly recommends changing the default password.
4. The NetGuardian's main menu will appear.
5. Type C for the C)onfig menu.
6. Type E for E)dit menu.
7. Type E for port settings, N for Net.
8. Configure the unit address, subnet mask, and default gateway.
9. ESC to the main menu.
10. When asked if you would like to save changes, type Y (yes).

11. Reboot to save the new configuration to the NetGuardian.
12. Now you can connect to the NetGuardian via LAN and use the Web Browser Interface to complete the configuration.

**!** RADIUS logons **are** case-sensitive. If the RADIUS server is unavailable or access is denied, the master password will work for craft port access only. Also, the "dictionary.dps" files (included on the Resource Disk) needs to be loaded on the RADIUS server for access-right definition. If RADIUS is enabled on the NetGuardian, local authentication will not be valid.

## 12.1.2 Edit PPP Port

Choose P)PP to edit your baud rate, depending on what device has been chose for the PPP port.

```

C)onfig P)roxy T)elnet D)ebug e(X)it
E)dit M)onitor P)ing S)tats T)une Modem R)eset Port (ESC) ? E
E)thernet n(V)ram P)PP R)ebboot s(Y)stem (ESC) ? P

```

*Select the baud rate for your PPP port*

### 12.1.3 Tune 202 Modem

Tuning the 202 modem on a NetGuardian 420 can only be done from the TTY interface (using either HyperTerminal through the front craft port or by telnet over LAN on port 2002).

```

9600 bps - HyperTerminal
File Edit View Call Transfer Help
Password: *****
NetGuardian v3.2D.0010
C)onfig P)roxy T)elnet D)ebug e(X)it
E)dit M)onitor P)ing S)tats T)une Modem R)eset Port (ESC) ? T
Tune Modem Port: 1) 4) (ESC) ? _

```

*Press 'T' to tune the 202 Modem with the TTY interface*

Though no menu options will appear, use the following commands to tune the 202 modem. Each menu option, when chosen, will output the character "A" on screen:

- 1) Minor Adjust DB+
- 2) Minor Adjust DB-
- 3) High Frequency
- 4) Low Frequency
- 5) Off
- 6) Major Adjust DB-
- 7) Major Adjust DB+
- 8) Median Frequency (Average of high and low frequency)

After selecting an option (like #1 in this example) for Minor Adjust the DB+ level, the NetGuardian will return a '+' command to inform you the task is completed. Each time you hit a number key (1-8), the NetGuardian will a '+' on your screen.

## 12.1.4 RADIUS Configuration

The TTY interface can also be used to configure RADIUS settings. After entering the IPA for the RADIUS server, users will be prompted for both a username **and** password to logon to the unit. This username and password combination will be verified against the RADIUS database, and not the local database. The local password database will only be used for front panel craft port access in the event the RADIUS configuration is making the unit otherwise inaccessible.

```

```

*RADIUS logon screen prompts for a Username and Password.*

## 12.1.5 New! - TTY Command Mode

This command line mode offers an alternate way of configuring the NetGuardian 420. This interface is scriptable, and is recommended for advanced users. Entries are NOT case sensitive.

```

NetGuardian- HyperTerminal
File Edit View Call Transfer Help
-----
Username: radius_admin
Password: *****
Radius Response: Administrative (superuser) Access Granted
NetGuardian864-65 v5.1F.0006
C)onfig P)roxy T)elnet D)ebug e(X)it
>get help
  
```

To enter Command Line mode, login to the TTY, then press Ctrl+C.

### Tips for using TTY Command Mode

- To enter command mode, login to the TTY interface and press Ctrl + C.
  - To view all acceptable operations, type **get help**, then press Enter.
  - Invalid commands will return "Error" as the response.
  - A **CRLF** is sent by the RTU following all responses from the RTU.
  - When setting commands, be sure to use "=" between the command and its parameter.
  - See the examples later in this section for more help with TTY mode.
- Limited data validation is in place using this method. Use caution when setting variable values.
  - In some cases, you need to reboot the NetGuardian for new variable values to take effect.
  - Changing **REF1**, **REF2**, **DISP1**, or **DISP2** affects the **MAJOR**, **MINOR**, **OVER**, and **UNDER** alarm thresholds. Changing any of these settings should be checked and re-established as required.
  - In the table below, variables (params) are noted in brackets.

Operation	Command	Params
<b>Help</b>	get help	None
<b>Initialize NVRAM</b>	init nvram {g2}	None
<b>Write NVRAM</b>	set nvram	None
<b>Read NVRAM</b>	get nvram	None
<b>View System Up Time</b>	get sysuptime	None
<b>View Firmware Version</b>	get prodid	None

**Examples**

- You want to find out how long this NetGuardian has been running (since last rebooted.) Get system uptime by typing **get sysuptime**, then press Enter.
- You want to see the alarm description for Base Alarm 1. To see the description, type **get alm base 1 desc**

```

## 12.2 Monitoring

### 12.2.1 Monitoring the NetGuardian

Connect a PC running VT100 terminal emulation software to the craft port or connect via LAN using a Telnet client with VT100 emulation to port 2002 to reach the monitor menu selection. This section allows you to do full system monitoring of the NetGuardian including: all alarms, ping information, relays, analogs, and system status.

```
C)onfig P)roxy T)elnet D)ebug e(X)it
E)dit M)onitor P)ing S)tats T)une Modem R)eset Port (ESC) ? M
A)larms R)elays a(N)alogs E)vent log a(C)cum. Timer
  B)AC P)ing targets p(O)rts S)ystem (ESC) ?
```

*The monitor menu allows status checking on all elements*

#### 12.2.1.1 Monitoring Base Alarms

View the status of the device connected to the discrete alarms from the M)onitor menu > A)larms option. Under **Status**, the word **Alarm** will appear if an alarm has been activated and **Clear** will appear if an alarm condition is not present. If groups are used the user defined status will be displayed.

```
A)larms R)elays a(N)alogs E)vent log a(C)cum. Timer
  B)AC P)ing targets p(O)rts S)ystem (ESC) ? A
B)ase E)xpansions (ESC) ? B

ID Description                               Status
 1                               Clear
 2                               Clear
 3                               Clear
 4                               Clear
 5                               Clear
 6                               Clear
 7                               Clear
 8                               Clear
 9                               Clear
10                               Clear
11                               Clear
12                               Clear
13                               Clear
14                               Clear
15                               Clear
16                               Clear
ESC to exit Any key to continue
```

*This example shows page two of the discrete alarms*

### 12.2.1.2 Monitoring Ping Targets

View the status of all your ping targets from the M)onitor menu > P)ing targets option. This screen displays the ping target ID, description, and IP address. Under **Status** the word **Alarm** will appear if an alarm has been activated and **Clear** will appear if an alarm condition is not present.

```

B)ase E)xpansions (ESC) ? <--
A)larms R)elays a(N)alogs E)vent log a(C)cum. Timer
B)AC P)ing targets p(O)rts S)ystem (ESC) ? P
ID Description IP Address Status
1 255.255.255.255 Clear
2 255.255.255.255 Clear
3 255.255.255.255 Clear
4 255.255.255.255 Clear
5 255.255.255.255 Clear
6 255.255.255.255 Clear
7 255.255.255.255 Clear
8 255.255.255.255 Clear
9 255.255.255.255 Clear
10 255.255.255.255 Clear
11 255.255.255.255 Clear
12 255.255.255.255 Clear
13 255.255.255.255 Clear
14 255.255.255.255 Clear
15 255.255.255.255 Clear
16 255.255.255.255 Clear
ESC to exit Any key to continue

```

*The Ping info submenu allows you to change ping targets*

### 12.2.1.3 Monitoring and Operating Relays (Controls)

The NetGuardian comes equipped with 4 relays that can be used to control external devices. Monitor the status of your relays from the M)onitor menu > R)elays option.

Relays 3 and 4 are set to normally open (N/O) as the factory default, but each or all of them can be changed to normally closed (N/C) by changing their respective jumper.

```

2 Normal Clear
3 Normal Clear
4 Normal Clear
S)tatus O)pr R)ls M)om (ESC) ?

```

*The eight relays can be operated from this screen*

#### 12.2.1.4 Monitoring Analogs

View the current reading and the alarm status of your analog devices from the M)onitor menu > a(N)alogs option. The value shown is a snapshot of the channels measurement, not a real-time reading. Refresh the readings by re-selecting the analogs option. Alarm status indicates that a preset threshold has been crossed and is designated by an **X**.

The 6 analog measuring inputs are set to measure voltage as the factory default. If your sensors output is current, change the appropriate analog shunt, to the current measuring position. The scaling worksheet in the provisioning section converts all readings shown here into native units, such as degrees Celsius or percent relative humidity.

```

B)ase E)xpansions (ESC) ?

```

*This display allows you to monitor your eight analog inputs*

### 12.2.1.5 Monitoring System Alarms

View the status of the NetGuardian's system alarms from the M)onitor menu > S)ystem option. Under **Status**, the word **Alarm** will appear if an alarm has been activated and **Clear** will appear if an alarm condition is not present. See Appendix, "System Alarm Descriptions," for more information. If groups are used the user defined status will be displayed.

```

A)larms R)elays a(N)alogs E)vent log a(C)cum.Timer
  B)AC P)ing targets p(O)rts S)ystem (ESC) ? S
ID Description          Status

48 Data 1 RcvQ Full     Clear
ESC to exit Any key to continue_

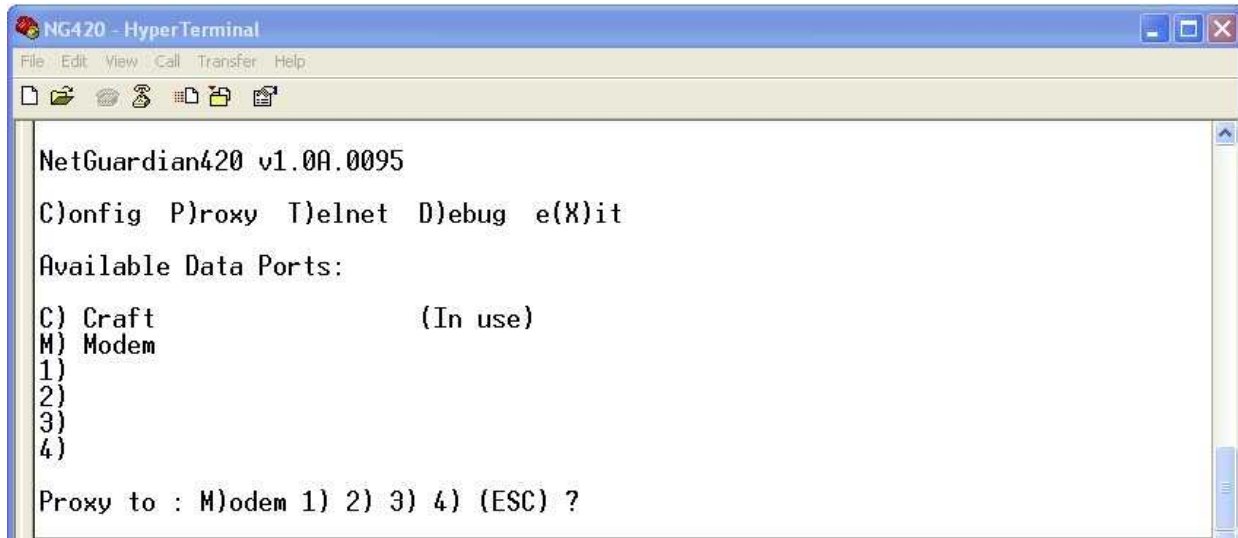

```

*System Alarms can be viewed from the M)onitor menu > S)ystem option*

### 12.2.1.6 Monitoring Data Port Activity

View the status of the NetGuardian's 4 data ports from the M)onitor menu > p(O)rts option. Enter the number of the port you wish to view and press Enter.

The NetGuardian provides an ASCII description under *Transmit* and *Receive*. Choose a) Transmit to view data transmitted to another device. Choose b) Receive to view data received from another device. See Appendix, "ASCII Conversion," for specific ASCII symbol conversion.

```

M) Modem
1)
2)
3)
4)
Proxy to : M)odem 1) 2) 3) 4) (ESC) ?

```

*Data port activity can be viewed from the M)onitor menu > p(O)rts option*

### 12.2.1.7 Monitoring the Accumulation Timer

The Accumulation Timer keeps a running total of the amount of time a point is in an alarm state. An alarm point that exceeds a user defined threshold will trigger a Accumulation Event system alarm. Refer to Figure 13.3.1.7.1. and Table 13.3.1.7.A to define the accumulation timer.

```

C)onfig P)roxy T)elnet D)ebug e(X)it
E)dit M)onitor P)ing S)tats T)une Modem R)eset Port (ESC) ? M
A)larms R)elays a(N)alogs E)vent log a(C)cum. Timer
  B)AC P)ing targets p(O)rts S)ystem (ESC) ? C
Accumulation Timer: enabled
  Display Reference: 1
  Point Reference: 11
  Point Description:
  Point Status: Clear
  Event Threshold: 00:01:01 (dd:hh:mm)
  Accumulated Time: 00:00:00 (dd:hh:mm)
  Accumulated Since: 22-July-2001 03:16
R)eset AccTmr (ESC) ?

```

*Monitor and reset the Accumulator Timer*

Field	Description
Display and Point	Indicates which alarm point is to be monitored.

<b>Reference</b>	
<b>Point Description</b>	The user-defined description of the monitored alarm point.
<b>Point Status</b>	The current status of the monitored point.
<b>Event Threshold</b>	Amount of time allowed to accumulate before the system alarm, "Accumulation Event" is triggered. <b>Note:</b> Maximum is 45 days.
<b>Accumulated Time</b>	The total time the monitored point has been in an ALARM state.
<b>Accumulated Since</b>	Indicates the last time the accumulation timer was reset.
<b>Reset Accumulation Timer</b>	Selecting this option will reset the timer.

*Field descriptions in the Accumulator Timer Settings*

## 12.2.2 Viewing Live Target Pings

Choose P)ing to ping any of the NetGuardian's user defined IP addresses. Then enter the ID number (1-32) of the IP address or enter any IP address to ping.

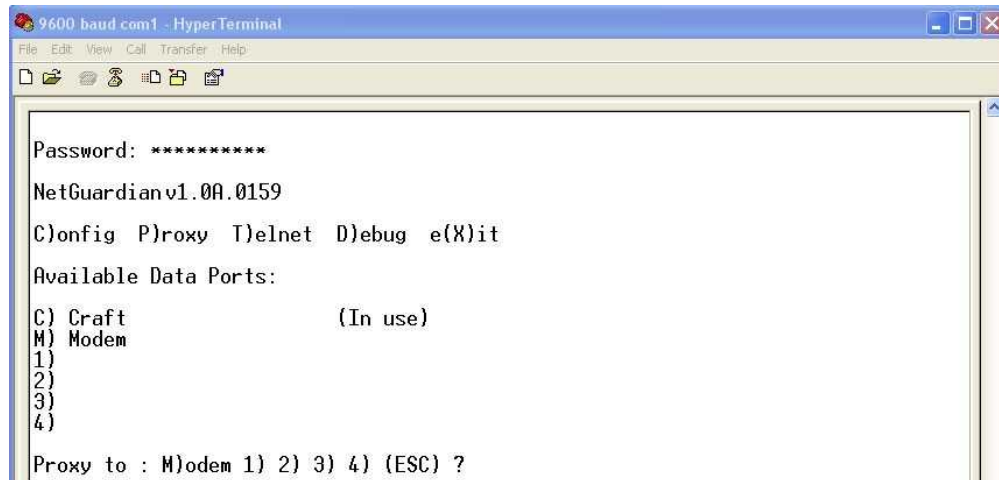

```
E)dit M)onitor P)ing S)tats T)une Modem R)eset Port (ESC) ? P
Ping Address / ID (1-32) :
```

*Continuously ping an IP address that has been defined in the NetGuardian's ping table*

## 12.2.3 Proxy Menu

You can create proxy connections to reach-through to the craft port, modem port or any of the other eight serial ports from the P)roxy menu. You'll be able to monitor and control additional devices via proxy connection to the NetGuardian. Data presented and handshaking will be specified by the connected device.

To cancel the proxy connection wait a half second, then quickly type @@@ and press ENTER.

```

1)
2)
3)
4)
Proxy to : M)odem 1) 2) 3) 4) (ESC) ?

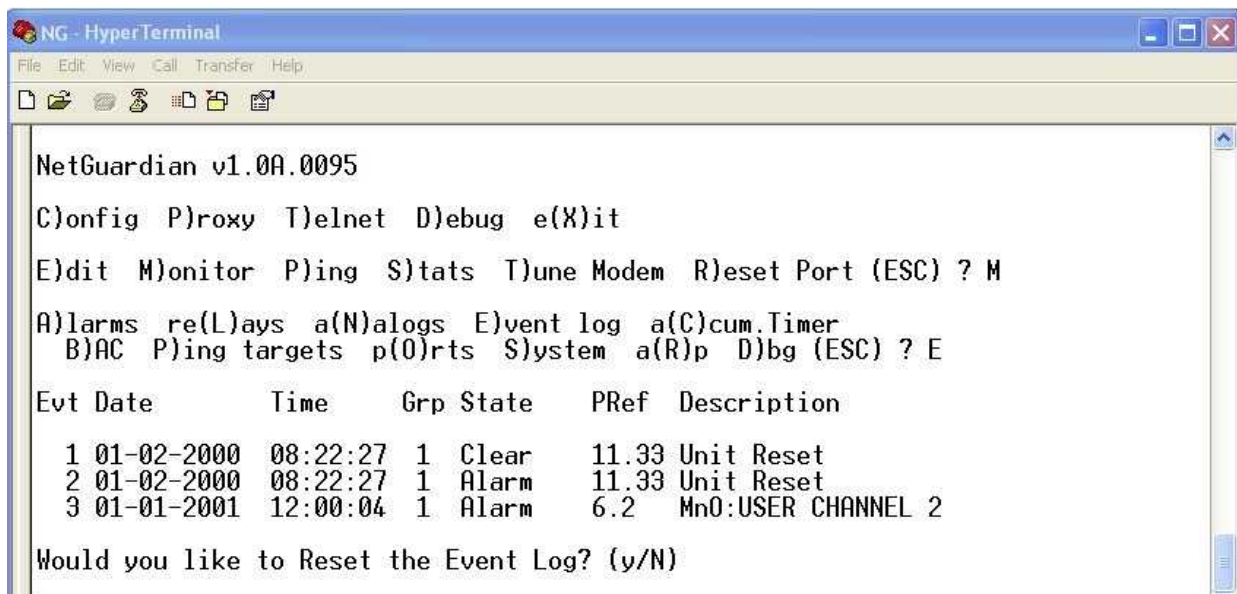

```

*Access devices connected to the eight data ports on the back panel through M)onitor menu > P)roxy option*

## 12.2.4 Event Logging

Choose E)vent log to view the up to 100 events posted to the NetGuardian; including power up, base and system alarms, ping alarms, analog alarms, and controls. Posted events for the various alarms include both alarm and clear status. Refer to Table 13.3.4.A for event log field descriptions.

**Note:** All information in the event log will be erased upon reboot or a power failure.

```

Would you like to Reset the Event Log? (y/N)

```

*Monitor the last 100 events recorded by the NetGuardian from the M)onitor menu > E)vent log option*

Event Log Field	Description
Evt	Event number (1–100)
Date	Date the event occurred
Time	Time the event occurred
Grp	Alarm Group
State	State of the event (A=alarm, C=clear)
PRef	Point reference (See Appendix A for display descriptions).
Description	User defined description of the event as entered in the alarm point and relay description fields.

*Event Log field descriptions*

## 12.2.5 Backing Up NetGuardian Configuration Data via FTP

1. From the Start menu on your PC, select RUN.
2. Type "ftp" followed by the IP address of the NetGuardian you are backing up (e.g. ftp 126.10.120.199).
3. After the connection is made press Enter.
4. Enter the password of the NetGuardian (default password is dpstelecom), then press Enter.
5. Type "binary" and press Enter (necessary for NetGuardian file transfer).
6. Type "lcd" and press Enter (this allows you to change the directory of your local machine).
7. Type "get" followed by the name you wish to define for the NetGuardian backup file. Add the extension ".bin" to the file name (e.g. get ngdbkup.bin) and press Enter.
8. After reloading, type "bye" and press Enter to exit.

**Note:** The backup file name can have a maximum of eight characters before the file extension.

### 12.2.5.1 Reloading NetGuardian Configuration Data

1. From the Start menu on your PC, select RUN.
2. Type "ftp" followed by the IP address of the NetGuardian you are backing up (e.g. ftp 126.10.120.199).
3. After the connection is made press Enter.
4. Enter the password of the NetGuardian (default password is dpstelecom), then press ENTER.
5. Type "binary" and press Enter (necessary for NetGuardian file transfer).
6. Type "lcd" and press Enter (this allows you to change the directory of your local machine).
7. Type "put" followed by the name you defined for the NetGuardian backup file and press Enter (e.g. put ngdbkup.bin).
8. Type "literal REBT" to reboot the NetGuardian.
9. After reloading, type "bye" and press Enter to exit.

## 12.2.6 Debug Input and Filter Options

Debug Input Options	
ESC	Exit Debug
B	Show BAC status points
T	Show task status
U	Show DUART information
R	Show network routing table
X	Clear debug enable bitmap. Turn all debug filters OFF
?	Display Options
Debug Filter Options:	
a	(1) Alarm toggle switch. Shows posting of alarm data
A	(2) Analog toggle switch. Shows TTY interface debug
c	(3) Config toggle switch. Shows TTY interface debug
C	(4) Control relay toggle switch. Shows relay operation
d	(5) DCP responder toggle switch. Shows DCP protocol
D	(6) Device toggle switch. Shows telnet and proxy information
e	(7) Expansion poller toggle switch. Shows NGDdx polling
E	(8) ECU Interrogator toggle switch. Shows BAC processing
f	(9) FTP Command toggle switch. Shows command string parsing
F	(10) FTP Data toggle switch. Shows FTP Read / Write
G	(11) GLD poller toggle switch. Shows GLD polling
h	(12) HTML debug switch. Shows Web Browser processing
H	(13) HWACS debug switch. Shows hardware access operation
i	(14) PING toggle switch
k	(15) Socket toggle switch. Shows current dcu resources
l	(16) LED toggle switch. Shows current LED state
L	(17) LCD display toggle switch. Shows LCD control and text
m	(18) Modem toggle switch. Shows modem vectored initialization
M	(19) Undefined
o	(20) Osstart toggle switch. Miscellaneous application debug, including NVRAM read and write operation, and event posting
O	(21) Undefined
p	(22) SPORT toggle switch. Port init debug and channeled port debug
P	(23) PPP toggle switch. Shows PPP functioning
q	(24) QAccess toggle switch. Reserved for future use
Q	(25) Undefined
r	(26) Report toggle switch. Shows reporting event activity, including SNMP, pagers, email, etc. Also shows PPP negotiation for NG client PPP mode.
s	(27) SNMP toggle switch. Reserved for future use
S	(28) STAK toggle switch. Shows network processing and IPA of arp requests. Also shows packets discarded by Filter IPA.
t	(29) TERM toggle switch. Shows UDP/TCP port handling. The camera and network time (NTP) jobs also use the TERM toggle switch
V	(30) Undefined
w	(31) HTTP toggle switch. Shows handling of web browser packets
W	(32) WEB toggle switch 2. Dump HTML text from web browser

*Table. 13.3.A. Debug Input and Filter Options*

## 13 Web Interface

The NetGuardian's Web Interface provides access to configure and monitor your NetGuardian.

### 13.1 Logging on to the NetGuardian

Your NetGuardian must first be assigned an IP address via the TTY interface before you will be able to connect via LAN/WAN using the Web Browser. If you have not yet done this, see **Ethernet Port Setup** in section 12 (TTY Interface) of this manual.

To connect to your NetGuardian:

1. Type the IP address of the NetGuardian in your web browser's address bar
2. Type your password in the password field that appears.

**Note:** The factory default password is **dpstelecom**.

Upon successfully logging in, you will be brought to the alarm summary screen in monitor mode.

The NetGuardian must be assigned an IP address before you will be able to connect via LAN/WAN using a Telnet client or a Web browser. To connect via LAN, the minimum configuration requires setup of the IP address and subnet mask. Minimum WAN configuration requires that the default gateway be set as well. Follow the instructions below to configure the NetGuardian's IP address, subnet mask, default gateway, trap address, SNMP port number, proxy base, and DHCP option.

## 13.2 Navigating the Web Interface

The links in the left pane of the web interface allow you to navigate to the monitoring or editing screen you wish to view.

Only links for the mode of operation you are in will be visible in the navigation pane.

The web interface has two modes of operation:

1. **Monitor Mode**, in which you may monitor your unit's alarms and issue controls.
2. **Edit Mode**, in which you may configure the unit

The unit defaults to Monitor Mode upon logging in. Clicking the green **Edit** button in the left pane of the web interface will take you to Edit Mode. From Edit mode, you may revert to Monitor Mode by clicking the blue **Monitor** button.

## 13.3 Edit Mode

Edit Mode provides the user access to all of the unit's configuration options.

If the **Edit** menu does not appear in the left frame after logging on, another station has already logged on as the primary user or you do not have access to edit the NetGuardian 420 database.

### 13.3.1 System Settings

From the System screen, you can enter basic user information for person responsible for the NetGuardian and configure basic settings for the unit.

System	
Name	NetGuardian420
Location	
Contact	
Phone	
Features	3955-7B-B995
Serial Number	0 (NOT SET)
Unit ID	0 (Disabled)
DCP Port	2001 UDP
DCP Protocol	DCPx
SCAN Unit ID	0 (Disabled)
SCAN Serial Port	0
Advanced	
Silence non-reportable system alarms	<input type="checkbox"/>
LCD Point Mode (uncheck for scroll)	<input type="checkbox"/>
DNP Address	202
DNP TCP Port 1	4004
DNP TCP Port 2	22001

Submit Data

Field	Description
Name	Used to set the Name of the Name@Location email address of the person responsible for the NetGuardian. <b>Note:</b> Name is the portion of the email address before the @ character.
Location	Used to set the Location Name@Location email address of the person responsible for the NetGuardian. <b>Note:</b> Location is the portion after the @ character and should be a host name or an IP address.
Contact	Provide information for how to contact the person responsible for this NetGuardian.
Phone	Enter the contact's telephone number.
Features	Used for entering feature codes for future upgrade features. Do not enter anything in this field unless so instructed by DPS Telecom
Unit ID	Enter a user definable ID number for this NetGuardian (DCP Address).
DCP Port	Enter the DCP Port for this NetGuardian. (1-8 serial otherwise UDP/IP Port) <b>Note:</b> DCPe added to the list of DCP protocols.
DCP Protocol	Choose between DCPx, DCPf, or DCPe.
Silence non-reportable system alarms	Check the box to silence alarms not applicable to your configuration. Example: This NetGuardian is not setup to send SNMP traps. Check this box to avoid receiving a failure notification for system alarm 13 (SNMP Trap not sent).
LCD Point Mode	Check this box to have the front panel LCD operate in "Point Mode". In this mode, only the points in alarm are displayed on the screen, instead of the full alarm descriptions. Point numbers for discrete alarms, analog threshold crossings, and latched relays will appear on the LCD.
DNP Address	The DNP3 unit address that the NetGuardian 420 will respond to. An address of 0 disables DNP3 responding.
DNP TCP Port 1	The TCP port that the NetGuardian 420 will listen on for DNP3 polling.
DNP TCP Port 2	The secondary TCP port that the NetGuardian 420 will listen on for DNP3 polling.

*System fields*

Once you've entered your information, click **Submit Data** to commit the data to the NetGuardian.

### 13.3.2 Defining SNMP Parameters

Access the **Edit > SNMP** link to view and edit your unit's SNMP settings.

To define your NetGuardian SNMP parameters:

1. From the **Edit** menu choose SNMP.
2. If you wish to restrict **Read and Write Access** to **All**, **v1-Only**, **v2c-Only**, or **v3-Only**, choose the appropriate option from the drop down dialog box..
3. Enter the community name for SNMP GET requests.
4. Enter the community name for SNMP SET requests.
5. Enter the community name for SNMP TRAPs.
6. If using SNMPv3, enter usernames and access information in the v3-User's section.
7. Define the **IP** address of your trap managers. Set to 255.255.255.255 if not using.
8. Define the **UDP** port set by the SNMP managers to receive traps; usually 162.
9. Select the Format in which you want your traps to be sent to your managers.
10. Click **Submit** to save your system information settings.

For more information on the above steps, see the field descriptions for the Edit SNMP screen in the table below.

SNMP						
<b>Globals</b>						
Read and Write Access		All				
v3 Engine ID		80000A7A030010810015CA				
<b>Community Names</b>						
Get		dps_public				
Set		dps_public				
Trap / v3-ContextName		dps_public				
<b>v3-Users</b>						
ID	Username	Access Mode	Auth Pass	Priv Pass		
1	noauthnopriv	No-Auth.No-Priv				
2	authnopriv	Auth-MD5.No-Priv	auth_pas:			
3	authpriv	Priv Auth-MD5	auth_pas:	auth_priv		
4		No-Auth.No-Priv				
<b>Global Trap Managers</b>						
ID	IPA	Port	Format	Retry	Seconds	v3-User
1	126.010.220.192	162	v3-Trap	1	1	1
2	255.255.255.255	162	v3-Trap	1	1	0

SNMP Menu

Globals	
<b>Read and Write Access</b>	<p>This field defines how the NetGuardian unit may be accessed via SNMP. This can be set to the following:</p> <ul style="list-style-type: none"> <li>All- Allows you to read or write using any version of SNMP (v1, v2c, v3)</li> <li>Disabled- Restricts all access to unit via SNMP</li> <li>v1-Only- Allows SNMPv1 access only</li> <li>v2c-Only- Allows SNMPv2c access only</li> <li>v3-Only- Allows SNMPv3 access only</li> </ul>
<b>v3 Engine ID</b>	<p>Specifies the v3 Engine ID for your NetGuardian device. DPS recommends using the default ID for the unit, which is automatically generated by the unit. The default ID is generated according to RFC3411 and is based on the unit's unique MAC address and DPS Telecom's SNMP enterprise number.</p> <p><b>Note:</b> To have the unit generate a unique Engine ID, clear the <b>v3 Engine ID</b> field and press the <b>Submit</b> key.</p>
SNMP Communities	
<b>Get</b>	Community name for SNMP requests.
<b>Set</b>	Community name for SNMP SET requests.
<b>Trap / v3 Context Name</b>	<p>Community name for SNMP TRAP requests. In SNMP v3, defines the context name field of a v3-Trap.</p> <p><b>Note:</b> Make sure that your community strings match those used by the SNMP manager. In v1 and v2c, community strings are security passwords; if the strings do not match, the SNMP manager will not accept Traps from the NetGuardian. Community strings are case sensitive.</p>
v3-Users	
<b>ID</b>	The user number designated for a v3-user. The NetGuardian supports up to four

	v3-User profiles.
<b>Username</b>	The name of the user for which an SNMPv3 management operation is performed.
<b>Access Mode</b>	This identifies the security modes available when SNMPv3 is utilized. The modes are as follows: <ul style="list-style-type: none"> <li>• <b>No-Auth, No-Priv</b>- This access mode does not require authentication and does not require encryption. This mode is the least secure and is comparable to v1 and v2c.</li> <li>• <b>Auth-MD5, No-Priv</b>- Provides authentication based on the MD5 algorithm and does not require encryption.</li> <li>• <b>Auth-SHA, No-Priv</b>- Provides authentication based on the SHA algorithm and does not require encryption.</li> <li>• <b>Priv Auth-MD5</b>- Provides authentication based on the MD5 algorithm and provides DES 56-bit encryption based on the CBC-DES standard.</li> <li>• <b>Priv Auth-SHA</b>- Provides authentication based on the SHA algorithm and provides DES 56-bit encryption based on the CBC-DES standard.</li> </ul>
<b>Auth Pass</b>	This field contains the password used with either MD5 or SHA authentication algorithms.
<b>Priv Pass</b>	This field contains the password used with privatization encryption.
<b>Global Trap Managers</b>	
<b>IPA</b>	Defines the SNMP trap manager's IP address. Set to 255.255.255.255 if not using.
<b>Port</b>	The SNMP port is the UDP port set by the SNMP manager to receive traps, usually set to 162.
<b>Format</b>	Select between v1-Trap, v2c-Trap, v2c-Inform, or v3-Trap.
<b>Retry</b>	Number of times the NetGuardian will resend SNMP v2c-Informs
<b>Seconds</b>	Time interval in seconds between attempts to resend SNMP v2c-Informs.
<b>v3-Users</b>	Association to the v3-User Table is made to specify the username, security mode, and passwords that should be used for sending a v3-Trap.

*Fields in the Edit > SNMP settings*

If you are using SNMPv3, any changes to the Engine ID or passwords will require a reboot. At bootup, you may experience a slight delay while the authorization and privatization keys update.

## 13.3.3 Controlling Access to the NetGuardian

### 13.3.3.1 Logon Settings

From the Logon screen, you can change basic logon information for the NetGuardian and create up to 16 unique user profiles each with individual rights to access the NetGuardian.

Logon			
Master Password			
Minimum Length	<input type="text" value="5"/>		
Password	<input type="password" value="••••••••"/>		
Confirm Password	<input type="password" value="••••••••"/>		
Quiet Logon	<input type="checkbox"/>		
Advanced			
ID	User	Password	Call Back Phone
1	<a href="#">DPS SUPPORT</a>	*****	559-454-1600

To change the Master password for the unit:

1. Set the minimum password length in the **Minimum Length** field.
2. Enter your new password and confirm the password in the appropriate fields.
3. Check the box if you wish to enable **Quiet Logon**. Quiet Logon keeps the user ID and Password fields from appearing when a user attempts to login to the TTY interface adding another layer of security should anybody mistakenly or maliciously attempt to access your NetGuardian.

To create or edit user profiles, click on the link in the **User** field. By default, the link will read **Available**.

### 13.3.3.2 Logon Profiles and Access Rights

The NetGuardian 420 allows you to setup up to 16 distinct user profiles and restrict and enable access rights to the NetGuardian based on those profiles.

**Note:** If you reach the Logon Profile screen by accident, you may return to the previous screen by clicking the back button on your browser, Logon from the navigation links in the left pane of the web interface, or by clicking **Edit Logon** at the bottom of the Logon Profile screen.

Logon Profile 1	
User	DPS_SUPPORT
Password	••••••••
Confirm Password	••••••••
Call Back	559-454-1600
Access Privileges	
Admin	<input checked="" type="checkbox"/>
DB Edit	<input checked="" type="checkbox"/>
Monitor	<input checked="" type="checkbox"/>
SDMonitor	<input checked="" type="checkbox"/>
Control	<input checked="" type="checkbox"/>
Reach-Through	<input checked="" type="checkbox"/>
Modem	<input checked="" type="checkbox"/>
Telnet	<input checked="" type="checkbox"/>
PPP	<input checked="" type="checkbox"/>

*Logon Profile Configuration Screen*

From the User Profile (1-16) screen, you can configure individual user profiles.

1. Enter a User ID in the **User** field
2. Enter and confirm the User's password in the appropriate fields
3. In the **Call Back** feature, enter the phone number the NetGuardian will use to call-back the user's modem.
4. Set **Access Privileges** for the user.

Profile Field	Access Privilege Descriptions
Admin	Enables the user to add/modify logon profiles and NetGuardian password information.
DB Edit	Enables the user to perform database edits in the NetGuardian.
Monitor	Enables the user to have Monitor access of the NetGuardian.
SDMonitor	Enables the user to view serial port buffers.
Control	Gives the user the ability to issue controls. This also automatically activates Monitor.
Reach-Through	Enables the user to achieve reach-through (Proxy) access.
Modem	Enables the user to call into the unit.
Telnet	Enables the user to have Telnet access to the unit.
PPP	Enables the user to access the PPP server with the user defined password.

*Access Privilege descriptions*

When you've finished creating or editing a user profile, click **Submit Data**.

### 13.3.3.3 Filter IPA Config and Operation

The Filter IPA table allows you to increase the NetGuardian's network security by allowing or blocking packets from specified IP addresses. Addresses which appear in the table will be processed by the NetGuardian. Defined IP addresses associated with network cameras or the network time server are automatically processed and will not be filtered out by this feature. Broadcast packets of 255.255.255.255 and ARP requests for the NetGuardian IP address are also not filtered.

1. From the **Edit** menu select **Filter IPA**.
2. A warning prompt will appear. Click **OK** to continue.

*Filter IPA warning prompt*

Filter IPA	
Enable IPA Table	<input type="checkbox"/>
Block these Addresses	<input type="checkbox"/> (Firewall Mode Enable/Disable)
IPA Table	
ID	Address
1	255.255.255.255 (255.255.255.255)
2	255.255.255.255 (255.255.255.255)
3	255.255.255.255 (255.255.255.255)
4	255.255.255.255 (255.255.255.255)
5	255.255.255.255 (255.255.255.255)
6	255.255.255.255 (255.255.255.255)
7	255.255.255.255 (255.255.255.255)
8	255.255.255.255 (255.255.255.255)
9	255.255.255.255 (255.255.255.255)
10	255.255.255.255 (255.255.255.255)
11	255.255.255.255 (255.255.255.255)
12	255.255.255.255 (255.255.255.255)

Submit Data

*Select Filter IPA from the Edit menu to configure your Filter IPA table*

3. Click the checkbox to **Enable IPA Table**.
4. Click the **Block These Addresses** if you wish to block only the addresses listed in the table. If you wish to allow only those IP Addresses listed in the table, do not check this box.
5. Enter the IP address of the machine(s) you would like to give access to the NetGuardian.
6. Click **Submit** to save the configuration settings.

**Hot Tip!**

Entering a zero in any of the octet fields will declare that part of the octet to be a wildcard.

**WARNING:** Does not work with networks that assign IP addresses. Use the wildcard field to open an entire subnet.

### 13.3.3.4 Radius Authentication Settings

RADIUS (Remote Authentication Dial In User Service) is an industry-standard way to manage logins to many different types of equipment in one central location. The NetGuardian 420 connects to your central RADIUS server. Every time a device receives a login attempt (usually a username and password), it requests an authentication from the RADIUS server. If the username & password combination is found in the server's database, an "access granted" reply is sent back to the unit, allowing the user to connect.

RADIUS	
Global Settings	
Retry	<input type="text" value="3"/>
Time-out	<input type="text" value="60"/> Seconds
Server 1	
IPA	<input type="text" value="255.255.255.255"/> (Disabled)
Port	<input type="text" value="1812"/>
Secret	<input type="text" value="default_secret"/>
Server 2	
IPA	<input type="text" value="255.255.255.255"/> (Disabled)
Port	<input type="text" value="1812"/>
Secret	<input type="text" value="default_secret"/>
<input type="button" value="Submit Data"/>	

*RADIUS configuration screen*

NetGuardian 420	
Username:	<input type="text" value="dps_user"/>
Password:	<input type="password" value="••••••"/>
<input type="button" value="submit"/>	
	

*RADIUS server prompt for Username **and** Password.*

To configure RADIUS authentication for your NetGuardian, input the appropriate information in the following fields:

Global Settings	
<b>Retry</b>	Enter the number of times the RADIUS server should retry a logon attempt
<b>Time-out</b>	Enter in the number of seconds before a logon request is timed out
Servers 1 / 2	
<b>IPA</b>	Enter the IP address of the RADIUS server
<b>Port</b>	Port 1812 is an industry-standard port for using RADIUS
<b>Secret</b>	Enter the RADIUS secret in this field

After successfully entering the settings for the RADIUS server, the NetGuardian Web Browser will prompt users for both a Username and Password, which will be verified using the information and access rights stored in the RADIUS database.

RADIUS logons **are** case-sensitive. If the RADIUS server is unavailable or access is denied, the master password will work for craft port access only. Also, the "dictionary.dps" files (included on the Resource Disk) needs to be loaded on the RADIUS server for access-right definition. If RADIUS is enabled on the NetGuardian, local authentication will not be valid.

## 13.3.4 Ethernet Settings

From the **Ethernet** screen, you can configure information for your NetGuardian 420's ethernet ports.

Ethernet	
<b>NET 1</b>	
Unit Address	010.000.050.060 (010.000.050.060)
Subnet Mask	255.255.000.000 (255.255.000.000)
Gateway	010.000.000.254 (010.000.000.254)
MAC Address	00.10.81.00.C4.C9
<b>NET 2</b>	
Unit Address	255.255.255.255 (000.000.000.000)
Subnet Mask	255.255.000.000 (000.000.000.000)
Gateway	255.255.255.255 (000.000.000.000)
MAC Address	00.10.81.00.C4.CA
<b>Global Ethernet Options</b>	
DNS Address 1	255.255.255.255
DNS Address 2	255.255.255.255
Proxy Base	3000
HTTP Port	80 (HTTP use 80, HTTPS use 443)
DHCP	<input type="checkbox"/>
Base URL	

To change Ethernet information, enter information in the appropriate fields and click **Submit Data**.

**NOTE:** If populated, a section for Net2 will be available and feature the same fields as Net1. It is important to configure Net1 and Net2 with UNIQUE IP addresses and subnet masks.

Field	Description
Unit Address	IP address of the NetGuardian
Subnet Mask	A road sign to the NetGuardian telling it whether your packets should stay on your local network or be forwarded somewhere else on a wide area network.
Default Gateway	An important parameter if you are on a network that is connected to a wide area network. It tell the NetGuardian which machine is the gateway out of your local network. Set to 255.255.255.255 if not using a gateway.
MAC Address	Hardware address of the NetGuardian (not editable, for reference only). <b>Note:</b> You can use the DNS names for: Date and time, SNMP and Notifications.
DNS Address	IP address of the domain name server. Set to 255.255.255.255 if not using.
Proxy Base	Defines the NetGuardian TCP ports used by data ports 1-8 (serial ports). Data port 1 receives the port number entered here. Data ports 2-8 receive the next 7 port numbers in ascending order. (i.e. TCP port 3000 through port 3007 at the IP address of the NetGuardian).
HTTP Port	Enter 80 if using HTTP, 443 if using HTTPS
DCHP	Toggles the Dynamic Host Connection Protocol On or Off
Base URL	The Base URL is the destination website address or the alarm point description hyperlinks. See Section "Using the Base URL Field."

*Field Descriptions on the Ethernet Screen*

### 13.3.4.1 Using the Base URL Field

The NetGuardian allows users to turn each alarm point description into a hyperlink. When utilized, the alarm description for each alarm point that appears in the monitor mode (for base alarms, ping targets, or system alarms) becomes a link that directs technicians/managers to specific Web pages or to other files viewable by a Web browser. This allows users to create easily accessible informational databases on how to handle specific alarm

conditions or other instructions. The hyperlinked page or file will be displayed in the main window frame of the NetGuardian Web browser. Follow the directions below to create hyperlinks for alarm point descriptions.

1. From the **Edit Menu** select **Ports**. Scroll down to the **Base URL** field, see Figure 2.5.
2. Enter your base URL (e.g. **http://www.dpstelecom.com**). The NetGuardian creates the links from the alarm point descriptions based on the URL. Once the base URL is entered, the NetGuardian automatically attaches a unique suffix to each alarm point. For example, if the base URL is **http://www.dpstelecom.com** the link for the base alarm at point 1 would be **http://www.dpstele.com/base1.html**, Base Alarm Point 2 would be **http://www.dpstele.com/base2.html**, and so on.
3. To add a suffix other than `html` to the hyperlinks, insert the text **&pntID;** into the base URL. This allows the user to specify the extension. For example, if the base URL is **http://www.dpstele.com/&pntID;.pdf**, the link for the base alarm at point 1 would be **http://www.dpstele.com/base1.pdf/**.

**Hot Tip!**

Any file type that is viewable in your Web browser (e.g. word document, PDF, txt, etc.) is a linkable file.

4. The same link structure applies to the Ping Alarms, System Alarms, and Analog Alarms fields. See Table 2.D for specific URL extension link information.

Alarm Page	Base URL web page link*
Base Alarms	Base1.html - Base20.html
Ping Alarms	Ping1.html - Ping32.html
System Alarms	System1.html - System64.html
Analog Alarms	Analog1.html - Analog8.html

*Table 2.D. Specific link extensions*

\* Using the **&pntID;** code in the base URL enables you to link to any file type viewable in your Web browser.

## 13.3.5 Configuring Ports

You'll configure your unit's modem and terminal server ports from the **Edit** menu > **Ports** screen.

### 13.3.5.1 Modem Settings

To configure your NetGuardian for PPP or Dial-up access, you may need to enter information in the Modem fields on the **Ports** screen.

To configure the modem port settings.

1. In the **Ring Count** field enter the number of rings before answering. (Default = 1)
2. The **Dial Init** and the **Answer Init** fields can be used if any other modem initialization settings need to be set. For example, the modem can be set to ignore the dial-tone by entering a character code in either the Answer Init (into the NetGuardian) or the Dial Init (out from the NetGuardian).
3. Click **Submit Data** to save your modem port settings.

Ports	
Craft	
Baud	9600
WFmt	8,N,1
Modem	
Ring Count	1
Answer Init	
Dial Init	

*Change the modem settings from the Edit menu > Ports screen*

Command	Description	
A	Answer command	
Bn	Select communications standard	
D	Dial	
	P	Pulse dial
	T	Tone dial
	R	Connect as answering modem
	W	Wait for dial tone
	,	Pause for the duration of S8
	@	Wait for silence
	!	Switch hook flash
;	Return to the command state	
En	Command echo	
Hn	Switch hook control	
In	Modem identification	
Ln	Speaker volume	
Mn	Speaker activity	
On	Online	
Qn	Responses	
Sr?	Interrogate register	
Sr=n	Set register value	
Vn	Result codes	
Xn	Result code set	
Z	Reset	

Modem commands may vary. See your modem user manual for commands specific to your modem.

If you set the ring count to 0, the NetGuardian will still be able to dial out for notifications, but will NEVER answer an incoming call.

### 13.3.5.2 Data Port Settings

Data port settings can be configured in the **Edit** menu > **Ports** screen.

To configure your data ports:

1. From the **Ports** window, scroll down to the **Data Ports** section.
2. Enter a description for each port with a connected device. You can configure baud rate, word format, and to ignore or remove CR/LF (carriage return/line feed) characters in either the input or output data stream for each port.
3. Click on the link in the **Type** field to choose the data port type. Advanced settings - baud rate, WFmt, CR/LF Mode, and RTS Times - can also be configured when you select an appropriate data port type. (See the following section for details.)
4. Under the options heading, enter in the appropriate number of GLDs (1-12) or NetGuardian Discrete Expansions (1-3) installed. Entering zero disables these options. If connecting more than 3 GLDs, the baud rate must be set to 9600.

**Note:** Your NetGuardian's expandability may depend on your unit's availability of RS-232 and RS-485 ports. Normally, NetGuardian expansion units are installed on port 3.

#### **Hot Tip!**

**NGDdx** is an abbreviation for "NetGuardian Expansion." Expansion units enable you to scale from 20 base alarms and 4 base relays to a maximum of 164 alarms and 28 relays. In addition to standard

DX units, you can use the NG480 (configured as a DX) as an expansion unit. The NG480 will give you an additional 80 alarms and 4 relays. You also have the option of adding the NetGuardian E16 DX, giving you 16 more alarm points and 16 more controls.

**Note:** You can have either 1 NG480 or 1 to 3 NGDdx units. You cannot have both at the same time.

Ports									
Craft									
Baud	9600								
WFmt	8.N.1								
Modem									
Ring Count	1

2		115200	8.N.1	Ignore	Ignore	0	0	OFF	N
3		115200	8.N.1	Ignore	Ignore	0	0	OFF	N
4		115200	8.N.1	Ignore	Ignore	0	0	OFF	N
Options									
NGDdx	0-NONE								
GLD or BSU	0 (Disabled)								
Submit Data									

*Configure the data port parameters from the Ports screen*

### 13.3.5.2.1 Data Port Types

Each of the NetGuardian's 8 data ports can be configured with different functions:

#### TCP

Makes reach-through available at TCP ports (Telnet).

#### RTCP

Raw TCP (negates Telnet negotiation). The RTCP (Raw TCP Data Port) negates Telnet negotiation and will allow all characters (including [FF]) to pass straight through from IP to serial or serial to IP.

#### HTCP

High speed TCP port (only 1 HTCP port is available). An HTCP, or High-speed TCP data port, which operates in Telnet Raw mode, is essentially the same as a RTCP port except that it has better performance and is more robust when transferring streaming data (like a data file). Unlike RTCP ports, the user can only assign one port as HTCP.

#### PTCP

Permanent TCP (during a proxy connection, the connection will never time out).

#### SPS8

Serial Port Switch 8. The Serial Port Switch 8 is an external device hub that allows the connection of up to eight serial port devices to a single NetGuardian data port. When an SPS8 port is selected, the NetGuardian will negotiate the connection for the user. To break the SPS8 connection and return to the normal NetGuardian interface, type @@@ and press Enter.

**Hot Tip!**

SPS8 ports do not support direct proxy. You must navigate via the TTY menu. If interfacing a T/Mon to SPS8 through a NetGuardian, set the port type to **TCP**.

### **UDP**

Makes reach-through available at UDP ports (up to 4 UDP ports available).

### **CHAN**

Creates logical bridge to odd/even partner. The odd/even partners are pairs of 1-2 and 3-4. This allows the NetGuardian to view communication traffic in either direction when inserted in the serial communication path between two devices. This is accomplished by going "in" to the NetGuardian with one device and "out" to the other device from the odd/even partner port. Data is passed directly from one port to its odd/even partner without being altered in any way. This ability greatly simplifies troubleshooting communication problems by isolating the non-communicating device.

When **CHAN** is selected, the NetGuardian automatically activates the odd/even partner as **CHAN**. Baud rates for the odd/even pairs can be set to any available rate except for any combination of 19200 and 38400 between the two ports. Use "SPO" filter debug to analyze protocol traffic in a terminal.

### **CRFT**

Causes the data port to have the same functionality as the front panel craft port.

### **CAP**

Allows the user to capture debug information. The debug information is stored in the receive queue of the NetGuardian (See section "Monitoring Data Port Activity" for more information). This is used primarily as a troubleshooting feature.

### **ECU**

For use if an ECU is connected to this port (see section "Building Access Controller").

## **13.3.5.2 Direct and Indirect Proxy Connections**

The NetGuardian supports both direct and indirect proxy connections. In a direct proxy connection, the user enters an IP address and port number to Telnet directly to a TCP serial port. In an indirect connection, the user navigates the TTY menu to select a proxy port. Because the TTY interface is password protected, thus providing greater security, indirect connections are preferred. Some users prefer to disable direct proxy for all connections in order to enforce the password security provided by the TTY interface.

To disable proxy connections you may either:

1. Set the proxy port to an uncommon value.
2. Set the data ports to **off** in the **Type** field. When set to **off**, the port is no longer associated with a TCP socket, which effectively disables the port from direct access. This is a more secure and convenient method of disabling proxy access.

### 13.3.6 Configure Alarm Notifications

The **Edit** menu > **Notification** screen allows you to configure methods for alarm notification. The following sections will explain how to configure individual methods for alarm notification.

Notification							
ID	Type	Phone/Domain	Pin/Rcpt/Port	Baud/WFmt		IPA	Group
1	SNMPv1			9600	8,N,1	126.010.230.170	0
2	Off			1200	7,E,1	255.255.255.255	0
3	SNMPv1			1200	7,E,1	255.255.255.255	0
4	Off			1200	7,E,1	255.255.255.255	0
5	Text			1200	7,E,1	255.255.255.255	0
6	Off			1200	7,E,1	255.255.255.255	0
7	Off			1200	7,E,1	255.255.255.255	0
8	Off			1200	7,E,1	255.255.255.255	0

Submit Data

*Multiple notification methods and group assignments are configured from the Notification screen*

Pager Format	Description
Alphanumeric Paging	Format recognizes numbers, letters, and symbols. Can receive information including alarm point addresses, alarm descriptions, time of alarms, and alarm state a.k.a TAP.
Numeric Paging	Format recognizes numbers only. Message is reported in the following order: [IP]*[Display][Address]*[State]. When read on the pager it appears as follows: 192.168.1.100 99.01.01.01
Text Paging	Can receive information including alarm point addresses, alarm descriptions, time of alarms, and alarm state. May be accessed using a terminal.
T/Mon Paging	The T/Mon may receive alarm information from the NetGuardian via dial-up and display alarm information, alarm description, and threshold status. (Only activates if DCP Poller is inactive)
TCP (ASCII) Paging	Alarm status notification via multiple TCP or HTCP ports. Connection from a higher level master must be established for alarm notification.
Email/SMTP Paging	Provides alarm notification via email, with a description similar to the Alphanumeric pager.
SNMPv1 Paging	May send alarm status to multiple SNMP managers, including the SNMP that alarms are reporting to. The SNMP trap format is v1.
SNMPv3 Paging	May send alarm status to multiple SNMP managers, including the SNMP that alarms are reporting to. The SNMP trap format is v3.
Num17 Paging	Provides alarm notification in a manner similar to that of the Numeric pager. However, Num17 eliminates the (*) symbol from the page. Message is reported in the following order: [IP][Display][Address][State]. When read on the pager it appears as follows: 192.168.1.100 99.01.01.01
Echo	Allows an alarm point on the NetGuardian to operate a control on another SNMP-enabled, DPS Telecom RTU.

*Notification formats*

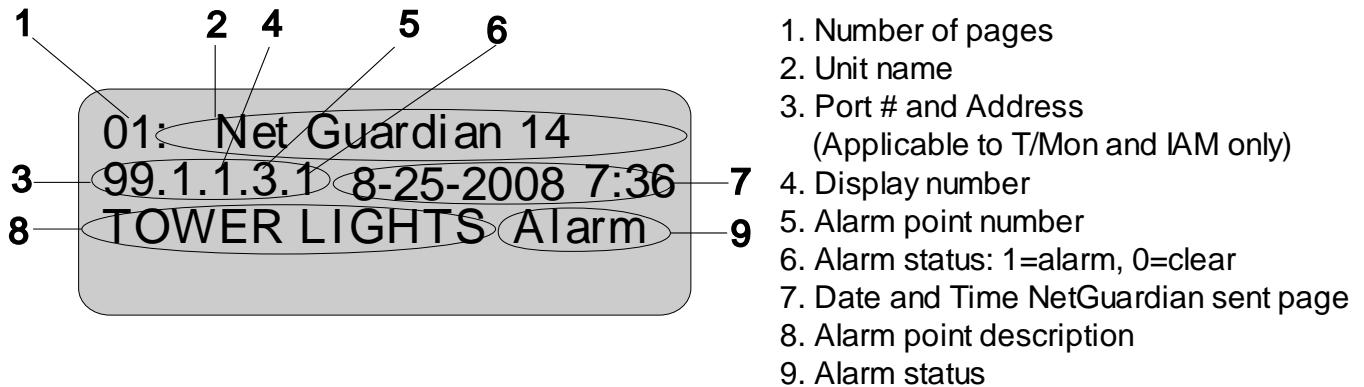

Many cellular carriers offer a TAP gateway to SMS. Check with your carrier to see if you can use a dial-up connection to send SMS messages to your phone. This creates an out-of-band path in the case of a network failure.

### 13.3.6.1 Alphanumeric Pager Setup

The alpha numeric pager can receive text messages including alarm descriptions, time of occurrence, and point addresses.

Use the following steps to configure the alpha numeric pager settings:

1. Under the **Type** column, select type **Alpha** from the drop-down menu, see Figure 2.14.
2. Enter the phone number of the Alpha numeric pager under the **Phone/Domain** heading.
3. Enter a personal identification number under the **PIN/Rcpt/Port** heading.
4. Set the pager data rate (i.e. 300, 1200, 2400 or 9600). The default baud is 1200.
5. Select a pager word format (Data Bits, Parity, Stop Bits). The default setting is 7,Even,1.

*Alpha numeric pager description*

### 13.3.6.2 SNPP Notification Setup

Alpha numeric pagers can receive text messages including alarm descriptions, time of occurrence, and point addresses using SNPP.

Use the following steps to configure the alpha numeric pager settings:

1. Under the **Type** column, select type **SNPP** from the drop-down menu.
2. Use the **Phone** field if a login username and password are required. They must be separated by a colon and be no longer than 29 characters combined. Otherwise, leave this field blank.
3. Enter the numeric pager number under the **PIN/Rcpt/Port** heading.
4. Under the IPA field, enter the static IPA of the SNPP server. Port automatically defaults to 444.

### 13.3.6.3 Numeric Pager Setup

The numeric pager can receive point addresses of alarms.

Use the following steps to configure the numeric pager settings:

1. Under the **Type** column select **Numeric** from the drop-down menu.
2. Enter the phone number of the numeric pager under the **Phone/Domain** heading, followed by 7 commas (e.g. **555-1212,,,,,,**). Placing a comma after the phone number initiates a two second pause (per comma). This allows enough time for the pager to answer before the NetGuardian sends the alarm information.

The Baud/Wfmt and IPA fields are not used from numeric pager types.

### 13.3.6.4 Text Paging Setup

Text pages can receive information including the point addresses of alarms, the alarm description, time of the alarm, and state (alarm or clear). The text pages may be viewed using a terminal such as HyperTerminal.

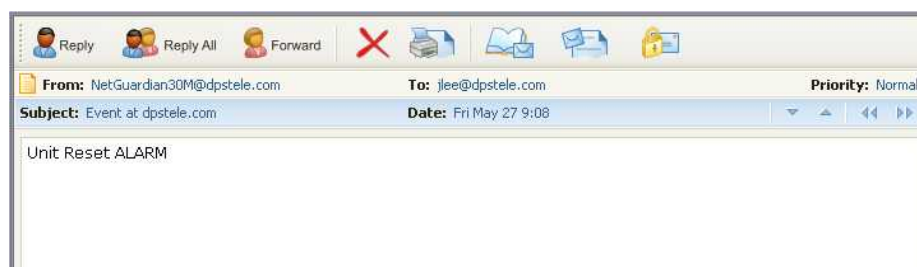

Use the following steps to configure the text paging settings:

1. Under the **Type** column select **Text** from the drop-down menu.
2. Enter the phone number of the text paging device under the **Phone/Domain** heading.
3. Set the pager data rate (i.e. 300, 1200, 2400 or 9600). The default baud is 1,200.
4. Select a pager word format (e.g Data bits: 7 or 8, Parity: none (N), even (E) or odd (O), and Stop Bits: 1). The default setting is 7, Even,1.

To set up text paging from T/Mon see the T/Mon user manual.

### 13.3.6.5 Email Notification Setup

*Email notification from the NetGuardian*

The email pager provides alarm notification via email, with a description similar to that of the alpha-numeric pager.

1. Use the following steps to configure the email notification settings:
2. Under the **Type** column, select **Email** from the drop-down menu.
3. Enter the domain name of the email address under the **Phone/Domain** heading. This is the portion of an email address after the @ symbol in **name@domain.com**.

**Note:** There cannot be any spaces in the domain name.

4. Enter the email recipient's user name under the **PIN/Rcpt/Port** heading. This is the portion of an email address before the @ symbol in the **name@domain.com**.

**Note:** There cannot be any spaces in the recipient's user name

5. Enter the IP address of the SMTP mail server in the **IPA** field.

6. Click **Submit Data** to save your email notification settings.

7. Click on the **System** link. If you have not done so, set up the "from" address sent in email messages sent from the NetGuardian by entering the appropriate information in the **Name** and **Location** fields. The email notification from the NetGuardian will appear as follows: **name@location**.

#### **Hot Tip!**

Most email programs can be set to perform a certain action if a message is received from a specified address, such as moving the message to a special Alarms folder. Use the address entered in the **Systems** screen for such purposes.

8. Click **Submit Data** to save your new system information settings.

The "from" email address is for identification purposes. It is not necessarily a real email address that can

be replied to unless one is entered.

### 13.3.6.5.1 SMTP & POP3 Authentication Support

This section contains steps to configure your NetGuardian for SMTP and POP3 Authentication support.

#### Unauthenticated Emails:

The configuration setup will not change. If you want the email to send to **user@yourdomain.com**, use the following steps:

1. In the **Phone/Domain** field type **yourdomain.com**.
2. In the **Pin/Rcpt** field type **user**.
3. Click **Submit Data** to save the configuration settings.

The "from" location is specified by the system info name and location strings, which also do not change. Use the following steps to configure the "from" location **from@fromdomain.com**:

1. Click on the **Edit** menu > **System** link.
2. In the **Name** field type **from**.
3. In the **Location** field type **fromdomain.com**.
4. Click **Submit Data** to save the new system information settings.

#### Authenticated Emails:

If you want to send an authenticated email to **user@yourdomain.com** from **from@fromdomain.com**, password = **authentic**, then use the following steps:

1. In the **Pin/Rcpt** field type **authentic**.
2. Click **Submit Data** to save your changes.
3. Click on the **Edit menu > System** link.
4. In the **Name** field type **user**.
5. In the **Location** field type **yourdomain.com**.
6. Click **Submit Data** to save the new system information settings.

### 13.3.6.6 SNMPv1 Paging Setup

The SNMPv1 paging feature allows you to view alarm status from multiple SNMP managers in addition to the global managers, which are setup from the SNMP menu.

Use the following steps to configure the SNMP paging settings:

1. Under the **Type** column, select **SNMPv1** from the drop-down menu.
2. Set the SNMP port under the **PIN/Rcpt/Port** heading, usually 162.
3. Enter the IP address of the SNMP manager in the **IPA** field.

### 13.3.6.7 SNMPv3 Paging Setup

The SNMPv3 paging feature allows you to view alarm status from multiple SNMP managers in addition to the global managers, which are setup from the SNMP menu.

Use the following steps to configure the SNMP paging settings:

1. Under the **Type** column, select **SNMPv3** from the drop-down menu.
2. Enter a v3-User ID under the v3-User heading. The values can range from 0-4. These values refer to the **v3-Users** table in the SNMP page. The v3-User association is used to specify username, security mode, and passwords that should be used for sending a v3-Trap.
3. Set the SNMP port under the **PIN/Rcpt/Port** heading, usually 162.
4. Enter the IP address of the SNMP manager in the **IPA** field.

### 13.3.6.8 TCP Paging Setup

```

<MSG_BEG 00001>
VID : DPS Telecom
FID : NetGuardian SNMP v5.0B.3206
SITE: Yale Office
PNT : 99.01.01.01
DESC: RECTIFIER 1
STAT: CLEAR
DATE: 01/01/2001
TIME: 12:17:02
<MSG_END 00001>

```

*Fig. 2.17. Example TCP message*

Heading	Description
MSG_BEG MSG_END	Sequential message number used to group the message and detect missing messages (e.g. 00001, 00002, etc...).
VID	Vendor ID
FID	NetGuardian Firmware ID.
SITE	NetGuardian system name.
PNT	Point ID (port.address.display.point). See Appendix A for display mapping.
DESC	Description set forth in the Alarm parameters.
STAT	Status of the alarm (Clear or Alarm).
DATE	Date the alarm occurred.
TIME	Time the alarm occurred.

*Table 2.H. TCP alarm message field descriptions*

The NetGuardian offers alarm status notification via multiple TCP ports. When an alarm condition occurs, an alarm condition formatted according to Figure 2.17 will be sent to the specified TCP points for use by a higher level master. This connection must be established by the master. Any applicable alarm activity occurring prior to an established connection will be discarded.

Use the following steps to configure the TCP paging settings:

1. Under the **Type** column, select **TCP** from the drop-down menu.
2. In the **Pin/Rcpt/Port** field enter the NetGuardian TCP port number where alarm messages will be sent (from 1 to 65,536). Multiple ports can be defined by defining multiple pager IDs as TCP pagers and then entering the desired ports.
3. The TCP message can be viewed by a Telnet session by connecting to the NetGuardian's IP address and the TCP port entered in this screen. For example, Telnet to **126.10.220.199 5000** if port 5000 is selected and 126.10.220.199 is the unit's IP address. See Figure 2.17 for an example message and Table 2.H for TCP message format information.

### 13.3.6.9 NUM17 Pager Setup

The Num17 Pager can receive point addresses of alarms. It is quite similar to the Numeric Paging format in the way it receives and reports alarms. However, on certain pager systems the symbol \* will cause a freeze or other undesirable situations. Num17 eliminates the \* symbol from the pagers it receives and reports alarms as a 17-digit series of numbers.

User the following steps to configure Num17 Pager settings:

1. Under the **Type** column select **Num17** from the drop-down menu.
2. Enter the phone number of the numeric pager under the **Phone** heading, followed by commas (for example **555-1212,,,,,**). Placing a comma after the phone number initiates a two second pause per comma. This allows enough time for the pager to answer before the NetGuardian sends the alarm information. The **Baud/Wfmt** and **IPA** fields are not used from Num17 pager types.
3. Click **Submit Data** to save the configuration settings.

### 13.3.6.1 Echo Notification Setup

An Echo notification type enables an alarm point on the NetGuardian to operate a control on another SNMP remote from DPS.

1. From the Notification devices tab, choose **Echo** as the notification Type.
2. Enter the Community Set Name in the Phone/Domain field.
3. Enter the Relay Point Reference in the Pin/Pcpt/Port field. This is entered as:[Port].[Address].[Display].[Relay Point] NOTE: The Port will always be 99, and the address is always 1. Therefore, your entries will always begin with 99.1.
4. The Baud/Wfmt and Group fields will not be used.
5. Under IPA, enter in the IP address of the SNMP-enabled, DPS remote you are setting up to operate its relay.

**NOTE:** If more than one point is mapped to Echo notification, the OR'ed logic is applied.

### 13.3.7 Defining Point Groups

Each NetGuardian Alarm point can be assigned to one of eight groups, which are identified with a user-defined label. Once the point groups are defined, the Point Group IDs can be used to group base and system alarms, see section "Configuring Base Discrete Alarms."

Use the following steps to define alarm messages for alarm point groups:

1. To define the point groups, select **Point Group** from the **Edit** menu.
2. Then enter the appropriate descriptions in the **Description**, **When Set** and **When Clear** fields for each point group.
3. Click **Submit Data** to save the point group settings.

Point Groups			
ID	Description	When Set	When Clear
1	<input type="text" value="Doors"/>	<input type="text" value="Open"/>	<input type="text" value="Closed"/>
2	<input type="text" value="Generators"/>	<input type="text" value="On"/>	<input type="text" value="Off"/>
3	<input type="text"/>	<input type="text"/>	<input type="text"/>
4	<input type="text"/>	<input type="text"/>	<input type="text"/>
5	<input type="text"/>	<input type="text"/>	<input type="text"/>
6	<input type="text"/>	<input type="text"/>	<input type="text"/>
7	<input type="text"/>	<input type="text"/>	<input type="text"/>
8	<input type="text"/>	<input type="text"/>	<input type="text"/>

*Define the Alarm and Clear messages for up to eight different point groups*

### 13.3.8 Configuring Base Discrete Alarms

All of the NetGuardian's 20 discrete alarms are configured from the **Edit** menu > **Base Alarms** screen. Descriptions of the alarm point, polarity (normal or reversed), whether to use an SNMP Trap or not, and the primary and secondary pager used to report the alarm, and group assignments, are configured in this screen.

Use the following steps to configure base discrete alarm settings:

1. From the **Edit** menu select the **Base Alarms** link.
2. Enter a description for each discrete input alarm being used in the **Description** field.
3. Under the **Polarity** column, you can choose to reverse the polarity or leave it normal. If you select **Normal**, a contact closure is an alarm. If the Reverse option is selected, the alarm is clear when closed.
4. Select the **Trap** check box to send an SNMP trap for that alarm point in the event of an alarm condition. Leave the box blank if you do not wish the NetGuardian to send an SNMP trap.
5. Set the primary and secondary pagers with a pager ID from your Notification list. (See Section "Configure Notification Methods" for more information.) The NetGuardian will notify both the primary and the secondary notification device when point status changes (both alarm and clear).
6. Under the **Group** column enter the appropriate point group ID. (For more information, see "Defining Point Groups.")
7. Under the **Qual** column click the **None** link to configure an event qualification time setting for the alarm point. The **Event Qual** screen will appear. For more information on the Qual field, see the section titled, "Event Qualification Timers".
8. Click **Submit Data** to save base alarm configuration settings.

The pager device can be an ASCII terminal, T/Mon element manager, email, or multiple SNMP managers as well as an alpha or numeric pager.

Base Alarms							
ID	Description	Polarity	Trap	Pagers		Group	Qual
				Pri	Sec		
1	Equip Major	Normal	<input checked="" type="checkbox"/>	0	0	1	<a href="#">None</a>
2	Equip Minor	Normal	<input checked="" type="checkbox"/>	0	0	1	<a href="#">None</a>
3	INTRSN	Normal	<input checked="" type="checkbox"/>	1	2	1	<a href="#">None</a>
4	BEACON	Normal	<input checked="" type="checkbox"/>	1	2	2	<a href="#">None</a>
5	SIDE LT	Normal	<input checked="" type="checkbox"/>	1	2	3	<a href="#">None</a>
6	HMDTY	Normal	<input checked="" type="checkbox"/>	1	2	3	<a href="#">None</a>
7	H2O LEAK	Normal	<input checked="" type="checkbox"/>	1	2	3	<a href="#">None</a>
8	FIRE	Normal	<input type="checkbox"/>	1	2	3	<a href="#">None</a>
9	TXAACTIVE	Normal	<input type="checkbox"/>	4	1	2	<a href="#">None</a>
10	TXBACTVIE	Normal	<input type="checkbox"/>	4	1	2	<a href="#">None</a>
11	DELAYED	Normal	<input type="checkbox"/>	0	0	3	<a href="#">None</a>

*Configure the 20 discrete alarms from the Base Alarms screen*

### 13.3.9 Configuring System Alarms

System Alarms					
ID	Description	Trap	Pagers		
			Pri	Sec	Group
17	Timed Tick	<input type="checkbox"/>	0	0	1
18	Exp.Module Callout	<input type="checkbox"/>	0	0	1
19	Network Time Server	<input type="checkbox"/>	0	0	1
20	Accumulation Event	<input type="checkbox"/>	0	0	1
21	Duplicate IP Address	<input type="checkbox"/>	0	0	1
33	Unit Reset	<input type="checkbox"/>	0	0	1
36	Lost Provisioning	<input type="checkbox"/>	0	0	1
37	DCP Poller Inactive	<input type="checkbox"/>	0	0	1
38	NET 1 is not Active	<input type="checkbox"/>	0	0	1
40	NET Link Down	<input type="checkbox"/>	0	0	1
41	Modem not Responding	<input type="checkbox"/>	0	0	1
42	No Dialtone	<input type="checkbox"/>	0	0	1
43	SNMP Trap not Sent	<input type="checkbox"/>	0	0	1

*SNMP Traps and primary or secondary pager devices can be selected for each system alarm*

The **System Alarms** screen allows you to individually set the notification method for each system alarm. See the "System Alarms Display Map" in the Reference Section for detailed descriptions of System Alarm Points.

To configure your system alarm notification settings:

1. From the **Edit** menu select the **System Alarms** link.
2. Check the **Trap** box to send an SNMP trap for that alarm point.
3. Set the primary and secondary pagers with a Notification ID from your defined notification list. (See Section "Configure Alarm Notifications" for more information.)

**Note:** The NetGuardian will notify both the primary and the secondary notification device when point status changes (both alarm and clear).

4. Under the **Group** column enter the appropriate Point Group ID, see section.
5. Click **Submit Data** to save the configuration settings.

### 13.3.1 Setting Ping Targets

Ping Targets									
ID	Description	IP Address	Trap	Pagers			Define to "ping" using SNMPv1 GET		
				Pri	Sec	Group	SNMP	System OID	Community
1	MAIN SERVER	126.010.215.202	<input type="checkbox"/>	0	0	1	<input checked="" type="checkbox"/>	sysObjectID	dps_public
2		255.255.255.255	<input type="checkbox"/>	0	0	1	<input type="checkbox"/>	Disabled	
3		255.255.255.255	<input type="checkbox"/>	0	0	1	<input type="checkbox"/>	Disabled	
4		255.255.255.255	<input type="checkbox"/>	0	0	1	<input type="checkbox"/>	Disabled	
5		255.255.255.255	<input type="checkbox"/>	0	0	1	<input type="checkbox"/>	Disabled	
6		255.255.255.255	<input type="checkbox"/>	0	0	1	<input type="checkbox"/>	Disabled	
7		255.255.255.255	<input type="checkbox"/>	0	0	1	<input type="checkbox"/>	Disabled	
8		255.255.255.255	<input type="checkbox"/>	0	0	1	<input type="checkbox"/>	Disabled	
9		255.255.255.255	<input type="checkbox"/>	0	0	1	<input type="checkbox"/>	Disabled	

*Fig. 2.23. Configure the ping target parameters from the Ping Info screen*

Each of the 32 ping targets can be provisioned with a description, an IP address, primary and secondary notification devices, and an option to verify connection using SNMPv1 GET.

**Note:** To set ping response and fail times, see the section titled **Setting System Timers**.

To configure the ping targets:

1. From the **Edit** menu select **Ping Targets**.
2. In the **Description** field, enter a description of the device to be pinged.
3. In the **IP Address** field enter the IP address of the device to be pinged.
4. Under the **Trap** column check the box to designate that an SNMP trap will be sent when an alarm condition exists. Leaving the box blank indicates that an SNMP trap will not be sent when an alarm condition exists.
5. Set the primary and secondary pagers with a Notification ID from your defined Notification list.

**Note:** The NetGuardian 420 will notify both the primary and the secondary notification device when point status changes (both alarm and clear).

6. Under the **Group** column enter the appropriate Point Group ID.
7. Under the **SNMP** column check the box to enable ping of the device using SNMPv1 GETs instead of traditional ICMP. If the box is not checked, the device will be pinged using traditional ICMP.
8. Select the OID to retrieve with the SNMP GET. The following is a list of available MIB variables in the **System OID** field:
  - sysDescr, OID .1.3.6.1.2.1.1.1.0
  - sysObjectID, OID .1.3.6.1.2.1.1.2.0
  - SysUpTime, OID .1.3.6.1.2.1.1.3.0
9. In the **Community** field enter the community string for the SNMP GET request. The community string must match the community string configured in the target device.
10. Click **Submit Data** to save the configuration settings.

### 13.3.1 Setting the Accumulation Timer

Accum. Timer	
Display Reference	<input type="text" value="0"/>
Point Reference	<input type="text" value="0"/>
Point Description	Undefined
Point Status	-
Event Threshold	<input type="text" value="00"/> days <input type="text" value="00"/> hours <input type="text" value="00"/> minutes
Accumulated Time	00:00:00 (ddhhmm)
Accumulated Since	22-Oct-2007 11:05
Reset Accumulation Timer	<input type="checkbox"/>

*Define the Accumulation Timer settings to send an Accumulation Event alarm*

The NetGuardian's **Accumulation Timer** keeps a running total of the amount of time a point is in an alarm state to send an Accumulation Event system alarm once the total time exceeds a defined threshold.

To configure the accumulation timer settings:

1. Go to the **Edit** menu and select the **Accum.\_Timer** link.
2. In the **Display Reference** field enter the display number to be monitored.
3. In the **Point Reference** field enter the alarm point to be monitored.
4. In the **Event Threshold** row enter the appropriate running total days, hours and minutes a point is in a alarm state in order to send an accumulation event system alarm.
5. Click **Submit Data** to save the configuration settings.

**Accumulated Time** indicates the number of days, hours, and minutes the timer's been running. **Accumulated Since** indicates when the Timer started.

**Hot Tip!**

Only check the **Reset Accumulation Timer** box if you wish to reset the timer.

The **Point Description**, **Point Status**, **Accumulated Time**, and **Accumulated Since** fields are not configurable. These fields will show the corresponding data of the point you configure for the accumulation timer after you have hit the **Submit Data** button.

### 13.3.1 Configuring Analogs

Each of the NetGuardian 420's analog channels must be individually configured to monitor data. The ADCs (analog to digital converters) support a range of  $-70$  to  $94$  VDC. There are four alarm trip points (thresholds) in ascending order: major under, minor under, minor over, and major over. You can choose the values for each of the thresholds on all channels. As with the other alarms, you can designate whether or not to send an SNMP trap when a threshold is crossed. The primary/secondary pager used to report the alarm is also set here. The thresholds must be set from **Under** to **Over** in either ascending or descending potential (or current) order. Thus the settings of  $-10$ ,  $-5$ ,  $5$  and  $10$  corresponding respectively to major under, minor under, minor over and major over is valid.

The analog alarms are set to measure voltage by default and the thresholds are reported as "native units." For example, you may set Channel 3 to measure outside temperature. If you were using a sensor with a measurable temperature range between  $-4^{\circ}$  to  $167^{\circ}$  Fahrenheit ( $-20^{\circ}$  to  $75^{\circ}$  Celsius). The voltage for that channel varies between  $1$  and  $5$  VDC for that sensor, which is to be reported as  $^{\circ}$  Fahrenheit (native units) where  $1$  volt represents  $-4^{\circ}$  Fahrenheit and  $5$  volts represents  $167^{\circ}$  Fahrenheit.

To change any one analog alarm to measure current instead, a dip switch setting must be changed. Refer to the NetGuardian hardware user manual for details on jumper locations and positions. The jumper inserts a  $250$  ohm shunt resistor across the input to convert the sensors current output to volts. Use ohms law to find the voltage drop across the  $250$  ohm shunt resistor (multiply the current by the resistance  $250$  ohms). Please refer to the operation manual for your sensor to determine any other conversion factors. This will allow you to correctly set the thresholds for **over** and **under** conditions.

Base Analogs									
ID	Description	Unit	Major Under	Minor Under	Minor Over	Major Over	Trap	Paggers	
								Pri	Sec
5	INPUT VOLTAGE A	VDC	-72.0000	-50.0000	-22.0000	-20.0000	<input type="checkbox"/>	0	0
7	INT TEMPERATUR	$^{\circ}$ F	35.0000	50.0000	89.0000	99.0000	<input type="checkbox"/>	0	0
8	EXT TEMPERATUR	$^{\circ}$ F	46.0000	47.0000	50.0000	51.0000	<input type="checkbox"/>	0	0

*The Analog Parameters can be viewed and changed from the Analogs screen*

1. From the **Edit** menu click on the **Analogs** link.
2. In the **Description** field enter a description for each analog channel being utilized.
3. Under the **Unit** column, click on the abbreviated units link (e.g VDC, RH, F, etc.).
4. Set **Reference 1** (VDC) to the minimum output (in volts DC) of the analog device being configured.
5. In the box next to **VDC** (the space may already contain the abbreviation VDC) enter an abbreviation for the native units (e.g. RH for relative humidity, F for  $^{\circ}$  Fahrenheit, etc.).
6. In the box below the abbreviated native unit setting enter the native unit amount that corresponds to the minimum output entered in the previous step.
7. Set **Reference 2** (VDC) to the maximum output (in volts DC) of the analog device being configured.
8. In the box next to **VDC** enter an abbreviation for the native units (e.g. RH for relative humidity, F for  $^{\circ}$  Fahrenheit, etc.).
9. In the box below the abbreviated native unit setting enter the native unit amount that corresponds to the maximum output entered in the previous step.
10. Enter the Point Group ID designated for each alarm level (MjU = Major Under, MnU = Minor Under, MjO = Major Over, MnO = Minor Under).
11. Click the **Submit Data** button to save the configuration settings.
12. Follow these steps for each analog channel being configured.

Base Analog 5									
ID	Reference 1		Reference 2		Group				Polarity
	VDC	VDC	VDC	VDC	MjU	MnU	MnO	MjO	
5	-60.0000	-60.0000	-22.0000	-22.0000	1	1	1	1	Normal

Submit Data

Reference 1 and reference 2 correspond to the minimum and maximum output values of your analog device

### 13.3.12.1 Integrated Temperature and Battery Sensor (Optional)

The optional integrated temperature and battery sensor allows the user to monitor surrounding temperature as well as the unit's current draw. This is only available if the NetGuardian was purchased with this option. If you are using the temperature or battery sensor, you must dedicate an analog port to each one (see user manual for connection information).

**CAUTION:** Ambient room temperature will be cooler than the NetGuardian integrated temperature.

#### Temperature Sensor

1. In the **Description** field enter a description in the analog channel you are using for the integrated temperature sensor. 7=internal and 8=external.
2. Under the **Unit** column, click on the abbreviated units link (e.g VDC, RH, F, etc.) to convert the reference units and the native units for that analog channel, see Figure 2.24.
3. In **Reference 1** enter **iF** (integrated Fahrenheit or external Fahrenheit) in the box next to **VDC** (the space may already contain the abbreviation VDC), see Figure 2.24. This enables the NetGuardian's pre-configured temperature settings. Repeat this step for **Reference 2**.
4. Set your desired thresholds.

#### Battery Sensor

1. In the **Description** field enter a description in the analog channel you are using for the integrated current sensor. 5= Battery A and 6= Battery B.
2. Set your desired thresholds. Be sure to set your thresholds in reference to your NetGuardian's power input (e.g. -24 VDC, -48 VDC, or wide range).

### 13.3.12.2 Analog Polarity Override

**eF** : external temperature sensor in fahrenheit or **iC** for celsius  
**iF** : integrated temperature sensor in fahrenheit or **iC** for celsius  
**oV+** : override polarity VDC to positive  
**oV-** : override polarity VDC to negative

If you have a positive powered NetGuardian, you may want to use this feature if you are using the internal battery sensor. The Web Browser Interface will override **oV+** and **oV-** tags and show **VDC**. So you won't have to view an uncommon looking tag while in monitor mode.

#### Analog Accuracy:

+/- 1% of analog range.

### 13.3.12.3 Analog Step Sizes

Analog Step Sizes	
Input Voltage Range	Resolution (Step Size)
0-5 V	.0015 V
5-14 V	.0038 V
14-30 V	.0081 V
30-70 V	.0182 V
70-90 V	.0231 V

*Analog step sizes*

### 13.3.13 Configuring Control Relays

*Configure controls in the Edit menu > Controls screen*

The NetGuardian 420's 4 relays can be identified and configured using the **Edit** menu > **Controls** screen.

Relays are normally open (N/O) by default. A circuit board jumper can be changed for each control to make it normally closed (N/C). Refer to

To configure your relays:

1. From the **Edit** menu, select the **Controls** link.
2. In the **Description** field enter a description for each control/relay being used.
3. Set the **Energize State** to either **Normal** or **Inverted**. Selecting **Normal** sets the relay's normal electrical state to **De-energized**. Selecting **Inverted** sets the relay's normal electrical state to **Energized**.
4. Check the **Trap** box to send an SNMP trap for that alarm point. Selecting the box will set that point to send a SNMP trap when the relay is activated, leaving the box blank will set that point to not send an SNMP trap.
5. Under the **Group** column enter the appropriate Point Group ID
6. Click **Submit Data** to save the configuration settings.

#### **Hot Tip!**

The Energize State is different than the normal state of the physical contact closure position of each relay, which is determined by circuit board jumpers. This gives you the added benefit of being able to monitor the wire. In the event of a power failure, the relay would de-energize back to its normal physical contact closure set by the circuit board jumper for that relay. Check your jumper settings and relay connections before setting to Normal or Inverted.

### 13.3.1 Setting Event Qualification Timers

Event qualification timers allow you to determine a length of time that must pass before an event can occur. For example: you may set a qualification timer that requires an alarm to be set for five seconds before it is reported.

Event Qual					
ID	PRef		Timer		Type
	Display	Point	Value	Units	
1	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
2	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
3	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
4	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
5	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
6	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
7	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
8	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
9	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
10	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
11	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
12	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
13	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
14	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
15	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼
16	<input type="text"/>	<input type="text"/>	<input type="text"/>	sec ▼	None ▼

*Edit the Even Qualification Timer settings from the Edit > Even Qual screen*

To configure Event Qual timers:

1. From the **Edit** menu select from the **Event Qual** drop down menu. The NetGuardian supports up to 128 Event Qualification Timers, which are grouped into sections of sixteen.
2. Enter the display and point number for the point you wish to qualify.

**Note:** the ID will correspond to Event Qualification. A list of displays and points can be found in Appendix B.

3. In the **Value** field enter the appropriate value (the field handles entries between 1 - 127).
4. Under the **Units** column, click on the drop-down menu and select the appropriate unit of time (sec, min, hour).
5. Under the **Type** column click on the drop-down menu and select the appropriate event type (Alm = alarm, Pri = primary, Sec = secondary).

**Note:** To delete an entry, set the **Type** to None.

6. When you are done making changes, scroll to the bottom of the page and click **Submit Data**.

**CAUTION:** Set conditions for alarms are qualified, clear conditions are not.

By referencing a control relay in the display and point fields, an event becomes a momentary relay time. Controls are mapped to Display 11, Points 1-4. See the Reference Section of this manual for display mapping information.

### 13.3.15 Setting System Timers

Timers		
	Value	Units
Cycle (1-120)	60	sec
Wait (1-12)	8	sec
Fail (1-120)	5	min
Sound (0-120)	6	sec
Channel (1-120)	2	min
Craft (0-120)	0	min
DCP (0-120)	30	sec
Tmd Tick (0-60)	0	min
PPP (0-120)	15	min
NTP Sync (0-120)	60	min
Proxy (0-120)	20	min
Web Timeout (0-120)	10	min
Web Refresh (5-120)	60	sec
LCD Delay (1-60)	2	sec

Submit Data

*When a target fails to respond to a ping within the fail time period, a fault is declared*

*Default timer settings*

The NetGuardian's System Timers allow you to control the rate of your pinging activity, time of speaker sounding, inactivity time for data ports, and discrete alarm detect time. Ping timer settings allow you to balance network traffic against alarm response times. Although you can change the values from their default settings, it is recommended that you use either the default settings or plan your settings so that there is no conflict among the timers. Specifically, the FAIL time should be set to several times the CYCLE time to allow multiple PINGs before a FAIL is declared. Likewise, the CYCLE time should be set to several times the wait time.

#### **Hot Tip!**

The smaller the CYCLE number, the sooner you will find out about failures; however, you will increase traffic on your network.

1. From the **Edit** menu select **Timers**.
2. Set the **Cycle** time. This determines how often the NetGuardian will go through its list of ping targets and

attempts to reach them with an ICMP ping. Set the value between zero and 120 and set the units to either seconds or minutes. Default is 60 seconds.

3. Set the **Wait** time. The NetGuardian waits after sending a ping request before it determines that the target is unreachable. Set the value between zero and 12 and set the units to either seconds or minutes. Default is 8 seconds.
4. Set the **Fail** time. This determines the period of time over which, if a unit has not responded, it is considered failed. Set the value between zero and 120 and set the units to either seconds or minutes. Default is 5 minutes.
5. Set the **Sound** time. This determines how long the NetGuardian's speaker will sound when an alarm occurs or clears. The alarm condition will still be present after the speaker shuts off. The sound timer only affects the duration of the audible alarm annunciation. Set the value between zero and 120 and set the units to either seconds or minutes.
6. Set the **Channel** time. This determines the period of time over which, if there is no activity on the data ports designated as channel ports, it is considered failed. Set the value between zero and 120 and set the units to either seconds or minutes. Alarm activity is indicated in Display 11, Point 62. (See Appendix A, "Display Mapping.")
7. Set the **Craft** time. This determines the period of time over which, if the device connected through a port designated as a **craft** port doesn't reset the timer, an alarm will be triggered. Set between 0 and 120 (min or sec). Alarm activity is indicated in Display 11, Point 63. (See Appendix A, "Display Mapping.")
8. Set the **DCP** time. Set between 0–120 (sec or min). This determines the period of time over which, if the NetGuardian does not receive a DCP poll, to trigger an alarm. Once the alarm is triggered, then dial back-up may be enabled if a T/Mon pager profile is configured.
9. Set the **Timed Tick** between 0–60 minutes. This is a "keep alive or heartbeat" function that can be used by Masters who don't perform integrity checks. For example, if you entered 30, the NetGuardian would notify you every 30 minutes. See section "Setting Up Notification Methods" for paging information.
10. Set the **PPP** time. Set between 0–120 for onDemand mode.
11. Set the **NTP Sync**. Set between 0–120 (sec or min).

**Note:** The timer settings are accurate to  $\pm$  one tick. This means that if a timer is set to one minute, it may actually respond anywhere from zero to two minutes. If your target time is one minute, then set the timer to 60 seconds so that it will respond anywhere from 59-61 seconds.

12. Set the **Proxy** time between 0-120 minutes. This indicates the length of time that has to pass before a proxy connection times-out from inactivity.
13. Set the **Web Edit Timeout** time between 5–120 minutes. This determines the period of time a Web edit page may be active without any activity. A logon is required if a Web edit timeout occurs. The default Web edit time is 10 mins.

**Note:** The time units are preset to minutes by default and cannot be changed.

14. Set the **Web Monitor Refresh** time between 5–120 seconds. This timer enables the user to specify how long the NetGuardian should wait before auto-refreshing a Monitor page to the Web browser. The default Web monitor refresh time is 60 seconds.

**Note:** The time units are preset to seconds by default and cannot be changed.

15. Set the **LCD Delay** time between 1–60 seconds. This timer is used when you have set the LCD to "Point Mode." This time is how long you want the alarm to be displayed on the front panel LCD screen. The default is 2 seconds.
16. Set the **LCD Scroll** speed between 100 to 1000 milliseconds. This timer is used to configure how much time passes for the LCD to continue scrolling. The default is 600 milliseconds.

### 13.3.1 Setting the System Date and Time

Date and Time	
Current Setting	
Date	01 / 26 / 2045
Day	Wednesday
Time	19 : 42 : 10
Network Time Configuration	
Time Server IPA	255.255.255.255 (Disabled)
Time Server Port	123
Timezone	Pacific
Observe DST	<input checked="" type="checkbox"/>
<input type="button" value="Submit Data"/>	

*The current date and time can be entered from the Date and Time screen or from an SNMP manager*

The date is entered in the mm/dd/yyyy format and the time is entered in the hh:mm:ss format.

#### **Hot Tip!**

The date and time can also be set from an SNMP manager.

Use the following steps to manually set the system's time and date:

1. From the **Edit** menu, select **Date and Time**, see Figure 2.31.
2. Enter the appropriate date, the day of the week, and time.
3. Click **Submit Data** to save the data and time settings.

The date and time will need resetting following a power failure or reboot unless your NetGuardian is equipped with the real-time clock option or network time is enabled.

### 13.3.16. Network Time Protocol Support

Date and Time	
Current Setting	
Date	01 / 27 / 2045
Day	Thursday
Time	11 : 04 : 48
Network Time Configuration	
Time Server IPA	255.255.255.255 (Disabled)
Time Server Port	123
Timezone	Pacific
Observe DST	<input type="checkbox"/>

Atlantic
Eastern
Central
Mountain
Pacific
Alaskan
Hawaiian
GMT

*Configure the Network Time Protocol feature in the Date and Time screen*

Network Time Protocol support enables you to set a server to provide your NetGuardian the correct date and time, so you don't have to enter the information if your NetGuardian loses power or has to be reset to factory settings.

To enable Network Time Support:

1. From the **Edit** menu select **Date and Time**.
2. Click on the **Time Zone** drop-down menu and select the appropriate time zone.
3. Put a check next to **Observe DST** if you are in an area that observes daylight saving.
4. Enter the IP of the network time server in the **Time Server IPA** field.

**Note:** To disable NTP support, simply set the **Time Server IPA** to 255.255.255.255

6. Click **Submit Data** to save the date and time settings.

### 13.3.1 PPP Modes

PPP	
Configuration	
Port	Modem
VJ Compression	<input checked="" type="checkbox"/>
Client	
Mode	Off
Phone	
Username	
Password	
Server	
Enable Server	<input type="checkbox"/>
Address	255.255.255.255 (Client Specified)

Submit Data

*Configure the PPP port settings in the Edit menu > PPP screen*

If the LAN connection to your remote sites fails, you can still keep in touch with your remote equipment by using

the NetGuardian as a PPP (Point-to-Point Protocol) server via dial-up.

To configure the NetGuardian as a PPP Server:

1. Select **PPP** from the **Edit** menu.
2. In the **Server** section check the **Enable Server** (also known as Hosting Mode) box.
3. Set the IP address that is given to the guest dialing in. (This must be a valid and available IP address for the subnet on the LAN you will be connecting to, the same one the NetGuardian is connected to.)
4. Click **Submit Data** to save your PPP settings.

Ports	
Craft	
Baud	9600
WFmt	8,N,1
Modem	
Ring Count	1
Answer Init	
Dial Init	

*Edit the Modem settings for the PPP server in the Edit menu > Ports screen > Modem section*

5. Select **Ports** from the **Edit** menu.
6. Scroll down to the **Modem** section. Make sure the **Ring Count** field is greater than 0.
7. In Answer Init String field type **&Q6**.
8. Click **Submit Data** to save your Modem changes.

Logon Profile 1	
User	DPS_SUPPORT
Password	••••••••
Confirm Password	••••••••
Call Back	559-454-1600
Access Privileges	
Admin	<input type="checkbox"/>
DB Edit	<input type="checkbox"/>
Monitor	<input type="checkbox"/>
SDMonitor	<input type="checkbox"/>
Control	<input type="checkbox"/>
Reach-Through	<input type="checkbox"/>
Modem	<input type="checkbox"/>
Telnet	<input checked="" type="checkbox"/>
PPP	<input checked="" type="checkbox"/>

Submit Data

Edit Logon

*Select PPP and Telnet access privileges in the Edit menu > Logon > Logon Profiles screen*

9. Make sure the users who will need it have the access privilege to access the unit via Telnet. Select **Logon** in the **Edit** menu.

### Hot Tip!

There can be up to 16 different user names and each one must have its own password.

10. Click the **Available** link or the user you want to have PPP and Telnet access privileges.
11. Under the **Access Privileges** section check the **PPP** and **Telnet** boxes.
12. Click **Submit Data** to save the configuration settings.
13. Select **Reboot** in **Edit** menu to reboot the NetGuardian. (See section "Rebooting the NetGuardian.")

You also need to configure your remote terminal modem in order to access your NetGuardian by following these steps:

**Windows 98 users:** Set baud rate to **9600**.

**Windows 2000, XP users:** In **Modem Configuration General** tab uncheck **Enable modem error control** and **Enable compression**.

**Mac OSX users:** Use standard dial-in.

## 13.3.1 Building Access Control

BAC			
Configuration			
BAC Unit ID	<input type="text" value="0"/>	(Disabled)	
Direction Enabled	<input checked="" type="checkbox"/>		
Latch on exit	<input type="checkbox"/>		
Entry Code			
ID	Default	ID	Default
1	<input type="text"/>	9	<input type="text"/>
2	<input type="text"/>	10	<input type="text"/>
3	<input type="text"/>	11	<input type="text"/>
4	<input type="text"/>	12	<input type="text"/>
5	<input type="text"/>	13	<input type="text"/>
6	<input type="text"/>	14	<input type="text"/>
7	<input type="text"/>	15	<input type="text"/>
8	<input type="text"/>	16	<input type="text"/>

Passwords entered in the NetGuardian will only remain valid until BAC provisioning information is downloaded from T/MonXM.

The Building Access Controller (BAC) option is only available for NetGuardian 420 builds with an RS-485 connection attached to an Entry Control Unit (ECU).

1. Enter the BAC unit ID number (This is the DCP address of the ECU. It must match the expansion address being polled by the master. Any range from 1-255 is acceptable or enter zero to disable the unit).
2. When **Direction** is enabled, users are required to enter a 1 for enter immediately following their password or a 4 for exit immediately following their password. For example, if the password is 4541600, and direction is enabled, users need to type in 45416001# to enter, or 45416004# to exit.
3. The Defaults column is where door passwords can be edited. These passwords are temporary passwords used primarily for turn up and test. A valid password is a combination of up to 14 digits. When a valid password is entered on the keypad, the NetGuardian will send a command to the Entry Control Unit (ECU) to operate the relay to energize the door strike.

### Hot Tip!

Be sure to define the data port you are using for the ECU as an **ECU** type.

To configure Building Access on T/Mon, see your T/MonXM manual.

## 13.3.1 Configuring IP Cameras

The NetGuardian SiteMon G2 provides users with live streaming video of their remote sites. The direct pan-and-tilt features allows users to visually check the status of their sites from the convenience of their desktop. The NetGuardian allows your to view up to four cameras from the NetGuardian web interface.

To configure your camera settings:

1. From the **Edit** menu select **Camera**.
2. Enter the appropriate information in the **Name**, **Description**, **IP Address**, and **MAC Address** fields for each of your cameras.

**Note:** See Section "Monitoring Camera Activity" for camera viewing options.

3. Click Submit Data to save your camera configuration settings.

Camera						
ID	Type	Name	Description	IP Address	MAC Address	Refresh
1	SiteMON G2	Camera 1	Office	10.0.226.187	FF.FF.FF.FF.FF.FF	5
2	SiteMON G2	Camera 2		255.255.255.255	FF.FF.FF.FF.FF.FF	0
3	Panasonic	Camera 3		255.255.255.255	FF.FF.FF.FF.FF.FF	0
4	Panasonic	Camera 4		255.255.255.255	FF.FF.FF.FF.FF.FF	0

Submit Data

*View live streaming video of your remote sites via Web browser*

### Appropriate Web Browser Settings

In order to perform the pan-and-tilt functions of the camera, your Web browser must be set to check for newer versions of stored pages at every visit to the page.

The directions for checking for newer versions of stored pages may vary depending on what version of Windows you are running. The instructions below are relevant to Internet Explorer 5.5 and 6.0 only.

1. With the Web browser open (Internet Explorer version 5.5 or later), click on **Tools** and select **Internet Options** from the drop-down menu.
2. Click on the **Settings** button under the **Temporary Internet files** heading.
3. Click on the **Every visit to the page** button and click **Ok**.

### 13.3.20 Alarm Sync

Clicking on the Alarm Sync link from the Edit menu will re-synchronize all of the NetGuardian alarms. This command clears all alarms, so that a new notification is sent for all standing alarms. This allows you to easily test alarm connections during turnup without rebooting the NetGuardian unit. A warning prompt will appear, click **Ok** to continue or **Cancel** to exit without resynchronizing your alarms.

*Click Ok to re-synchronize the NetGuardian alarms or Cancel to exit*

### 13.3.21 Saving Changes or Resetting Factory Defaults

Your NetGuardian 420 comes equipped with Non Volatile RAM (NVRAM), which enables the retention of data in the event of power loss. You may use the NVRAM function from the web interface to either write your changes to the NetGuardian or revert to factory defaults.

Some changes require a reboot of the NetGuardian to take effect, see Section "Rebooting the NetGuardian."

To access NVRAM:

1. From the **Edit** menu select **NVRAM**.
2. Select **Write** to cause the current data in RAM to be written to NVRAM and then verified.
3. Select **Initialize** to reload factory defaults into NVRAM.

**DO NOT SELECT THIS OPTION UNLESS YOU WANT TO RE-CONFIGURE YOUR NETGUARDIAN.**

4. Select **Purge BAC** to delete the Building Access Controller profile database downloaded from T/Mon XM.

NVRam	
Action	Description
Write	Writes current values to NVRam.
Initialize	Sets NVRam to default values.
Purge BAC	Deletes the BAC Profile Database.
Action <input type="text" value="Select"/> <input type="button" value="Submit Data"/>	

*NVRAM enables the NetGuardian to retain data even through a power loss*

### 13.3.21.1 Rebooting the NetGuardian

Click on the **Reboot** link from the **Edit** menu to reboot the NetGuardian after writing all changes to NVRAM. Any changes to port settings require a reboot to take effect. The window footer will display the text **Reboot Needed** if a reboot is necessary to initiate changes.

## 13.4 Monitor Mode

From Monitor Mode, you can monitor all of the unit's alarms, analogs, ping targets, cameras, and issue controls. When you logon to the NetGuardian, it will be in Monitor Mode. To revert to Monitor Mode from Edit Mode, simply click the blue Monitor button.

### 13.4.1 Alarm Summary

Alarm Summary	
Type	Active Alarms
<a href="#">Base Alarms</a>	0
<a href="#">Ping Targets</a>	0
<a href="#">Base Analogs</a>	2
<a href="#">System Alarms</a>	1
Summary by Group	
Name	Active Alarms
<a href="#">Group 1</a>	3
<a href="#">Group 2</a>	0
<a href="#">Group 3</a>	0
<a href="#">Group 4</a>	0
<a href="#">Group 5</a>	0
<a href="#">Group 6</a>	0
<a href="#">Group 7</a>	0
<a href="#">Group 8</a>	0

Entering Monitor Mode will bring you to the Alarm Summary Screen. From here, you can see the total number of active alarms, ping targets, analogs, and system alarms. You can also view alarms by point group. Click any of the links in the Alarm Summary to see details or use the navigation links on the left to browse your NetGuardian's alarms and resources.

### 13.4.2 Base Alarms

From the Base Alarms screen, you can view the state of your NetGuardian's 20 base alarms.

Base Alarms		
Point	Description	State
1	DOOR	Clear
2	BEACON	Clear

If you added alarms to point groups, the state field will display the appropriate set or clear messages. If you're ever unsure of the set or clear messages, green font will always indicate a cleared alarm, red will always indicate a set alarm.

### 13.4.3 Ping Targets

You can monitor your NetGuardian's 32 ping targets from the **Monitor > Ping Targets** screen.

Ping Targets		
Point	Description	State
1		Clear

If you added your ping targets to point groups, the state field will display the appropriate set or clear messages. If you're ever unsure of the set or clear messages, green font will always indicate a cleared alarm, red will always indicate a set alarm.

### 13.4.4 Base Analogs

The **Monitor** menu > **Analogs** screen provides a description of each analog channel, the current reading, the units being read, and alarm conditions (major under, minor under, major over, minor over) according to your analog settings.

Base Analogs							
Chn	Description	Reading	Units	MjU	MnU	MnO	MjO
5	INPUT VOLTAGE A	-49.3702	VDC				
7	INT TEMPERATURE	80.6204	iF				
8	EXT TEMPERATURE	51.3041	eF			x	x

### 13.4.5 System Alarms

The System Alarms link will show you the state of your NetGuardian's internal alarms.

System Alarms		
Point	Description	State
17	Timed Tick	Clear
18	Exp.Module Callout	Clear
19	Network Time Server	Clear
20	Accumulation Event	Clear
21	Duplicate IP Address	Clear

If you added alarms to point groups, the state field will display the appropriate set or clear messages. However, in the state field, green font will always indicate a cleared alarm, red will always indicate a set alarm.

### 13.4.6 Accum Timer

Clicking on **Accum. Timer** will take you to the Accumulation Timer. From here, you can see how many times an alarm (configured from the Accum Timer field in Edit Mode) has occurred in a set period of time.

Accum. Timer	
Display Reference	0
Point Reference	0
Point Description	Undefined
Point Status	-
Event Threshold	00:00:00 (ddhhmm)
Accumulated Time	00:00:00 (ddhhmm)
Accumulated Since	01-Jan-2001 12:00

## 13.4.7 Controls

Selecting **Controls** from the Monitor Mode navigation menu gives the user access to the unit's control relays

Controls			
ID	Description	Mode	State
1		Normal	Rls <input type="button" value="v"/>
2		Normal	Rls <input type="button" value="v"/>
3		Normal	Rls <input type="button" value="v"/>
4		Normal	Rls <input type="button" value="v"/>

To operate controls:

1. Under the **State** field, choose a command (Opr - operate, Rls - release, or Mom - momentary).
2. Click **Submit Data** to issue the control.

The control relay's normal state - open or closed - is determined by a PCB jumper. Operating a control thus changes the normal state of the relay (energizes it) until it is released (de-energized). By default, the momentary command energizes the relay for approximately one second before it is released again. Use the event qualifiers to extend the momentary period.

## 13.4.8 Event Log

To view a log of alarm events, click **Event Log** in the Monitor Menu Navigation frame.

Event Log							<input type="button" value="Reset"/>
Evt	Date	Time	Grp	State	PRef	Description	
1	01-27-2045	09:50:39	1	Alarm	10.4	MJO:EXT TEMPERATURE	
2	01-27-2045	09:50:39	1	Clear	10.4	MJO:EXT TEMPERATURE	
3	01-27-2045	09:50:36	1	Alarm	10.4	MJO:EXT TEMPERATURE	
4	01-27-2045	09:50:33	1	Clear	10.4	MJO:EXT TEMPERATURE	
5	01-27-2045	09:50:28	1	Alarm	10.4	MJO:EXT TEMPERATURE	
6	01-27-2045	09:50:27	1	Clear	10.4	MJO:EXT TEMPERATURE	
7	01-27-2045	09:50:26	1	Alarm	10.4	MJO:EXT TEMPERATURE	
8	01-27-2045	09:50:26	1	Clear	10.4	MJO:EXT TEMPERATURE	
9	01-27-2045	09:50:25	1	Alarm	10.4	MJO:EXT TEMPERATURE	
10	01-27-2045	09:50:25	1	Clear	10.4	MJO:EXT TEMPERATURE	
11	01-27-2045	09:50:24	1	Alarm	10.4	MJO:EXT TEMPERATURE	
12	01-27-2045	09:50:22	1	Clear	10.4	MJO:EXT TEMPERATURE	
13	01-27-2045	09:50:19	1	Alarm	10.4	MJO:EXT TEMPERATURE	
14	01-27-2045	09:50:19	1	Clear	10.4	MJO:EXT TEMPERATURE	
15	01-27-2045	09:50:16	1	Alarm	10.4	MJO:EXT TEMPERATURE	
16	01-27-2045	09:50:12	1	Clear	10.4	MJO:EXT TEMPERATURE	
17	01-27-2045	09:50:11	1	Alarm	10.4	MJO:EXT TEMPERATURE	
18	01-27-2045	09:50:11	1	Clear	10.4	MJO:EXT TEMPERATURE	
19	01-27-2045	09:50:10	1	Alarm	10.4	MJO:EXT TEMPERATURE	
20	01-27-2045	09:50:09	1	Clear	10.4	MJO:EXT TEMPERATURE	

The NetGuardian's Event Log allows the NetGuardian to post and monitor up to 100 events including power up, base and system alarms, ping alarms, analog alarms, and controls. Posted events for the various alarms include both alarm and clear status. All information in the event log will be erased upon reboot or a power failure.

Event Log Field	Description
Evt	Event number (1-100)
Date	Date the event occurred
Time	Time the event occurred
St	State of the event (A=alarm, C=clear)
Pref	Point reference.
Description	User defined description of the event as entered in the alarm point and relay description fields

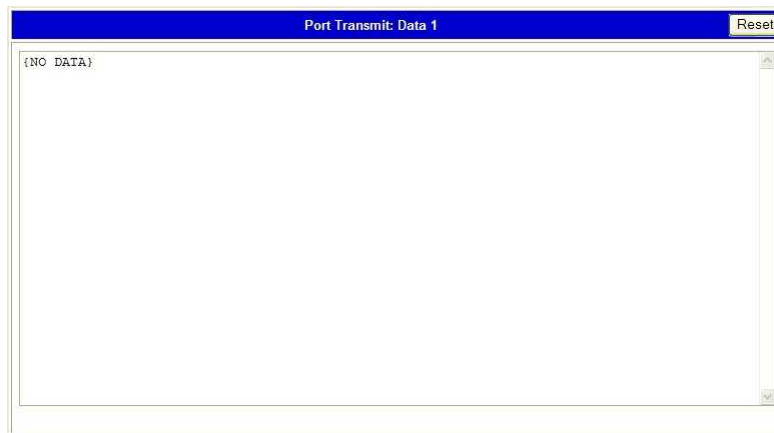

*Event Logging window field descriptions*

### 13.4.9 Monitoring Port Activity

*To view the data being received by the connected equipment, select the data port number from the Monitor menu > Port Receive drop-down menu*

The **Port Transmit** and **Port Receive** screens provide live status information for the NetGuardian's 4 data ports by displaying transmit or receive activity in ASCII for the selected port. See "ASCII Conversion" in the Reference Section of this manual for specific ASCII symbol conversion.

*The Port Transmit screen displays activity for the selected port*

#### **Hot Tip!**

Use the NetGuardian's CHAN feature to analyze bi-directional communication between two device in real time, see section "Data Port Types."

# 14 Reference Section

## 14.1 Display Mapping

Port	Address	Display	Points	Description	Set	Clear
99	1	1	1-20	Discrete Alarms 1-20	8001-8020	9001-9020

			33-37	DX 3 Analog Channel 4	6480-6484	7480-7484
99	1	28	1-5	DX 3 Analog Channel 5	6485-6489	7485-7489
			33-37	DX 3 Analog Channel 6	6490-6494	7490-7494
99	1	29	1-5	DX 3 Analog Channel 7	6495-6499	7495-7499
			33-37	DX 3 Analog Channel 8	6500-6504	7500-7504

*Display descriptions and SNMP Trap numbers for the NetGuardian*

\* The TRAP number ranges shown correspond to the point range of each display. For example, the SNMP Trap "Set" number for alarm 1 (in Display 1) is 8001, "Set" for alarm 2 is 8002, "Set" for alarm 3 is 8003, etc.

\*\* The TRAP number descriptions for the Analog channels (1-8) are in the following order: minor under, minor over, major under, and major over. For example, for Analog channel 1, the "Set" number for minor under is 8129, minor over is 8130, major under is 8131, and major over is 8132.

### 14.1.1 System Alarms Display Map

Display	Points	Alarm Point	Description	Solution
11	17	Timed Tick	Toggles state at constant rate as configured by the Timed Tick timer variable. Useful in testing integrity of SNMP trap alarm reporting.	To turn the feature off, set the Timed Tick timer to 0.
	18	Exp. Module Callout	Alarm is triggered whenever an alarm point from an Entry Control Unit (ECU) is collected. A notification event may be associated with the alarm to force a call out or trap.	Disable Building Access Control (BAC) by setting the BAC Unit ID to 0. If Building Access is being used, then investigate the ECU alarm source or don't associate notification with the alarm event.
	19	Network Time Server	Communication with Network Time Server has failed.	Try pinging the Network Time Server's IP Address as it is configured. If the ping test is successful, then check the port setting and verify the port is not being blocked on your network.
	20	Accumulation Event	An alarm has been standing for the time configured under Accum. Timer. The Accumulation timer enables you to monitor how long an alarm has been standing despite system reboots. Only the user may reset the accumulated time, a reboot will not.	To turn off the feature, under Accum.Timer, set the display and point reference to 0.
	21	Duplicate IP Address	The unit has detected another node with the same IP Address.	Unplug the LAN cable and contact your network administrator. Your network and the unit will most likely behave incorrectly. After assigning a correct IP Address, reboot the unit to clear the System alarm.
	22	D-Wire Sensor Not Detected	A configured D-Wire Sensor is not detected.	Check G5 D-Wire port and D-Wire Sensor and confirm cable is plugged in. Also make sure that configured ROM ID's match the D-Wire Sensors plugged in.
	33	Power Up	The unit has just come-online. The set alarm condition is followed immediately by a clear alarm condition.	Seeing this alarm is normal if the unit is powering up.
	36	Lost Provisioning	The internal NVRAM may be damaged. The unit is using default configuration settings.	Use Web to configure unit. Power cycle to see if alarm goes away. May require RMA.

---

**Note:** Table 14.1.1.A. continues on following pages.

Display	Points	Alarm Point	Description	Solution
11	37	DCP Poller Inactive	The unit has not seen a poll from the Master for the time specified by the DCP Timer setting.	If DCP responder is not being used, then set the DCP Unit ID to 0. Otherwise, try increasing the DCP timer setting under timers, or check how long it takes to cycle through the current polling chain on the Master system.
	38	NET1 not active	The Net1 LAN port is down.	Check LAN cable. Ping to and from the unit. (If not using Net1 or Net2, set IP, Subnet and Gateway to 255's)
	39	NET2 not active	The Net2 LAN port is down.	
	40	LNK Alarm	No network connection detected	
	41	Modem not responding	An error has been detected during modem initialization. The modem did not respond to the initialization string.	Remove configured modem initialization string, then power cycle the unit. If alarm persists, try resetting the Modem port from the TTY interface, or contact DPS for possible RMA.
	42	No Dial Tone	During dial-out attempt, the unit did not detect a dial tone.	Check the integrity of the phone line and cable.
	43	SNMP Trap not Sent	SNMP trap address is not defined and an SNMP trap event occurred.	Define the IP Address where you would like to send SNMP trap events, or configure the event not to trap.
	44	Pager Queue Overflow	Over 250 events are currently queued in the pager queued and are still trying to report.	Check for failed notification events that may be filling up the pager queue. There may be a configuration or communication problem with the notification events.
	45	Notification failed	A notification event, like a page or email, was unsuccessful.	Use RPT filter debug to help diagnose notification problems.
	46	Craft RcvQ full	The Craft port received more data than it was able to process.	Disconnect whatever device is connected to the craft serial port. This alarm should not occur.
	47	Modem RcvQ full	The modem port received more data than it was able to process.	Check what is connecting to the NetGuardian. This alarm should not occur.
	48	Serial 1 RcvQ full	Serial port 1 (or appropriate serial port number) receiver filled with 8 K of data (4 K if BAC active).	Check proxy connection. The serial port data may not be getting collected as expected.
	49	Serial 2 RcvQ full		
	50	Serial 3 RcvQ full		
	51	Serial 4 RcvQ full		
	52	Serial 5 RcvQ full		
	53	Serial 6 RcvQ full		
54	Serial 7 RcvQ full			
55	Serial 8 RcvQ full			

## System Alarms Descriptions (continued)

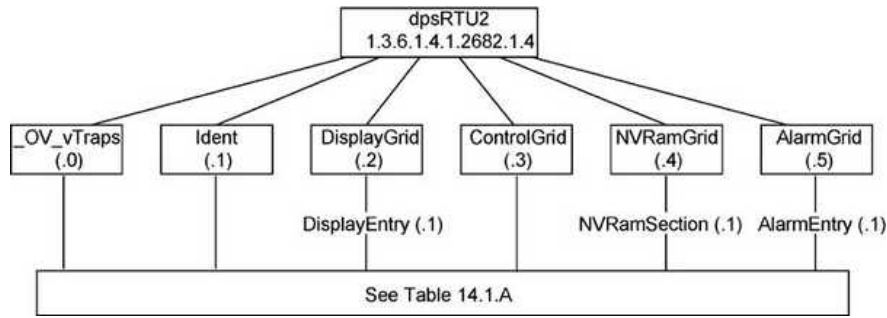

Display	Points	Alarm Point	Description	Solution
11	56	NetGuardian DX 1 fail	NGDdx 1 Fail (Expansion shelf 1 communication link failure)	Under Ports > Options, verify the number of configured NGDdx units. Use EXP filter debug and port LEDs to help diagnose the problem. Use DB9M to DB9M with null crossover for cabling. Verify the DIP addressing on the back of the NGDdx unit.
	57	NetGuardian DX 2 fail	NGDdx 2 Fail (Expansion shelf 2 communication link failure)	
	58	NetGuardian DX 3 fail	NGDdx 3 Fail (Expansion shelf 3 communication link failure)	
	59	GLD 1 fail	GLD address 1 is failed.	Connect just GLD unit 1 and attempt to poll. Verify GLD is connected to data port 8 and the hardware is RS485, not RS232.
	60	GLD 2 fail	GLD address 2 is failed.	Verify the GLD unit addressing, and test GLD units individually on the GLD communication bus.
	61	GLD 3+ fail	One or more GLD units addressed 3 through 12 may be failed.	Reduce the number of connected GLD units to determine which unit may be causing the link to fail.
	62	Chan. Port Timeout	Chan. Port has not forwarded any traffic in the time specified by the Channel Timeout Timer. The channel feature forwards data between two ports so the NG may be used to analyze serial traffic using CHAN filter debug.	Change the data port type to OFF, or set the Channel Timer to a different setting.
	63	Craft Timeout	The Craft Timeout Timer has not been reset in the specified time. This feature is designed so other machines may keep the TTY link active. If the TTY interface becomes unavailable to the machine, then the Craft Timeout alarm is set.	Change the Craft Timeout Timer to 0 to disable the feature.
64	Event Que Full	The Event Que is filled with more than 500 uncollected events.	Enable DCP timestamp polling on the master so events are collected, or reboot the system to clear the alarm.	

## System Alarms Descriptions (continued)

## 14.2 SNMP Manager Functions

The SNMP Manager allows the user to view alarm status, set date/time, issue controls, and perform a resync. The display and tables below outline the MIB object identifiers. Table B.1 begins with dpsRTU; however, the MIB object identifier tree has several levels above it. The full English name is as follows:

root.iso.org.dod.internet.private.enterprises.dps-inc.dpsAlarmControl.dpsRTU. Therefore, dpsRTU's full object identifier is 1.3.6.1.4.1.2682.1.4. Each level beyond dpsRTU adds another object identifying number. For example, the object identifier of the Display portion of the Control Grid is 1.3.6.1.4.1.2682.1.4.3.3 because the object identifier of dpsRTU is 1.3.6.1.4.1.2682.1.4 + the Control Grid (.3) + the Display (.3).

## 14.3 SNMP Granular Trap Packets

Tables 14.3.A and 14.3.B provide a list of the information contained in the SNMP Trap packets sent by the NetGuardian.

SNMP Trap managers can use one of two methods to get alarm information:

1. Granular traps (not necessary to define point descriptions for the NetGuardian)
- or
2. The SNMP manager reads the description from the Trap.

UDP Header	Description
1238	Source port

## 14.5 ASCII Conversion

The information contained in Table D.1 is a list of ASCII symbols and their meanings. Refer to the bulleted list below to interpret the ASCII data transmitted or received through the data ports. Port transmit and receive activity can be viewed from the Web Browser Interface.

- Printable ASCII characters will appear as ASCII.
- Non-printable ASCII characters will appear as labels surrounded by { } brackets (e.g. {NUL}).
- Non-ASCII characters will appear as hexadecimal surrounded by [ ] brackets (e.g. [IF]).
- A received BREAK will appear as <BRK>.

Abbreviation	Description	Abbreviation	Description
NUL	Null	DLE	Data Link Escape
SOH	Start of Heading	DC	Device Control
STX	Start of Text	NAK	Negative Acknowledge
ETX	End of Text	SYN	Synchronous Idle
EOT	End of Transmission	ETB	End of Transmission Block
ENQ	Enquiry	CAN	Cancel
ACK	Acknowledge	EM	End of Medium
BEL	Bell	SUB	Substitute
BS	Backspace	ESC	Escape
HT	Horizontal Tabulation	FS	File Separator
LF	Line Feed	GS	Group Separator
VT	Vertical Tabulation	RS	Record Separator
FF	Form Feed	US	Unit Separator
CR	Carriage Return	SP	Space (blank)
SO	Shift Out	DEL	Delete
SI	Shift In	BRK	Break Received

ASCII symbols

## 14.7 DNP3 Configuration / Interoperability Guide

### 14.7.1 DNP v3.0 Device Profile

The following table provides a "Device Profile Document" in the standard format defined in the DNP 3.0 Subset Definitions Document. While it is referred to in the DNP 3.0 Subset Definitions as a "Document," it is in fact a table, and only a component of a total interoperability guide.

<b>DNP V3.0</b> <b>DEVICE PROFILE DOCUMENT</b> (Also see the DNP 3.0 Implementation Table in Section 4.6.2)	
Vendor Name: <b>DPS Telecom Inc.</b>	
Device Name: <b>NetGuardian 420</b>	
Highest DNP Level Supported:  For Requests: <b>Level 3</b>  For Responses: <b>Level 3</b>	Device Function:  <input type="checkbox"/> Master  <input checked="" type="checkbox"/> <b>Slave</b>
Notable objects, functions, and/or qualifiers supported in addition to the Highest DNP Levels Supported (the complete list is described in the attached table):  <b>The read function code for Object 50 (Time and Date), variation 1, is supported.</b>	
Maximum Data Link Frame Size (octets):  Transmitted: <b>292</b> Received: <b>292</b>	Maximum Application Fragment Size (octets):  Transmitted: <b>512</b> Received: <b>512</b>
Maximum Data Link Re-tries:  <input type="checkbox"/> None <input checked="" type="checkbox"/> <b>Fixed (3)</b>	Maximum Application Layer Re-tries:  <input checked="" type="checkbox"/> <b>None</b> <input type="checkbox"/> Configurable
Requires Data Link Layer Re-tries:  <input checked="" type="checkbox"/> <b>Fixed (3)</b> <input type="checkbox"/> Always <input type="checkbox"/> Sometimes	

Requires Application Layer Confirmation:

- Never
- Always
- When reporting Event Data (Slave devices only)
- When sending multi-fragment responses (Slave devices only)**
- Sometimes

Permissions Field: **No**

File Events Assigned to Class: **No**

File Events Send Immediately: **No**

Multiple Blocks in a Fragment: **No**

Max Number of Files Open: **0**

## 14.7.2 DNP V3.0 Implementation Table

The following table identifies which object variations, function codes, and qualifiers the NetGuardian 420 supports in both request messages and in response messages. For static (non-change-event) objects, request send with qualifiers 00, 01, 06, 07, or 08 will be responded with qualifiers 00 or 01.

OBJECT			REQUEST (Library will parse)		RESPONSE (Library will respond with)	
Object Number	Variation Number	Description	Function Codes (dec)	Qualifiers Codes (hex)	Function Codes (dec)	Qualifiers Codes (hex)
1	1	Binary Input	1 (read)	00, 01 (start-stop) 06 (no range, or all)	129 (response)	00, 01 (start-stop)
10	2	Binary Output Status	1 (read)	00, 01 (start-stop) 06 (no range, or all)	129 (response)	00, 01 (start-stop)
12	1	Control Relay Output Block	5 (direct op) 6 (dir. op, noack)	17, 28 (index)	129 (response)	echo of request
30	3	32-Bit Analog Input Without Flag	1 (read)	00, 01 (start-stop) 06 (no range, or all)	129 (response)	00, 01 (start-stop)
50	1	Time and Date	1 (read)	07 (limited qty = 1)	129 (response)	07 (limited qty = 1)
			2 (write)	07 (limited qty = 1)		
60	1	Class 0 Data	1 (read)	06 (no range, or all)		
60	2	Class 1 Data	1 (read)	06 (no range, or all)		
60	3	Class 2 Data	1 (read)	06 (no range, or all)		
60	4	Class 3 Data	1 (read)	06 (no range, or all)		

### 14.7.3 DNP V3.0 Point List

The tables below identify all the default data points provided by the NetGuardian 420.

Obj 01 Var 01 - Single-bit Binary Inputs Obj 02 Var 02 - Binary Input Change with Time		
Point Index	Description/Points	Class
0-19	Discrete Alarms 1 - 20	0,1
20-51	Ping Targets 1-32	0,1
52-99	System Alarms 17-64	0,1
100-163	DX1 Discrettes 1-64	0,1
164-227	DX2 Discrettes 1-64	0,1
228-291	DX3 Discrettes 1-64	0,1
292-295	Controls 1-4	1
296-303	DX1 Controls 1-8	1
304-311	DX2 Controls 1-8	1
312-319	DX3 Controls 1-8	1
320-327	Analog1 1-8	1
328-335	Analog2 1-8	1
336-343	Analog3 1-8	1
344-351	Analog4 1-8	1
352-359	Analog5 1-8	1
360-367	Analog6 1-8	1
368-375	Analog7 1-8	1
376-383	Analog8 1-8	1
384-391	DX1 Analog1 1-8	1
392-399	DX1 Analog2 1-8	1
400-407	DX1 Analog3 1-8	1
408-415	DX1 Analog4 1-8	1
416-423	DX1 Analog5 1-8	1
424-431	DX1 Analog6 1-8	1
432-439	DX1 Analog7 1-8	1
440-447	DX1 Analog8 1-8	1
448-455	DX2 Analog1 1-8	1

456-463	DX2 Analog2 1-8	1
464-471	DX2 Analog3 1-8	1
472-479	DX2 Analog4 1-8	1
480-487	DX2 Analog5 1-8	1
488-495	DX2 Analog6 1-8	1
496-503	DX2 Analog7 1-8	1
504-511	DX2 Analog8 1-8	1
512-519	DX3 Analog1 1-8	1
520-527	DX3 Analog2 1-8	1
528-535	DX3 Analog3 1-8	1
536-543	DX3 Analog4 1-8	1
544-551	DX3 Analog5 1-8	1
552-559	DX3 Analog6 1-8	1
560-567	DX3 Analog7 1-8	1
568-575	DX3 Analog8 1-8	1

### Binary Output Status Points and Control Relay Output Blocks

<p><b>Binary Output Status Points</b>  Static Variation: Obj 10 Var 02 - Binary Output Status</p> <p>Request function codes supported: 5 (direct operate), 6 (direct operate, no ack)  Supported relay output: Latch on, Latch off.</p>		
Point ID	Description	Class
0	Control 1	0
1	Control 2	0
2	Control 3	0
3	Control 4	0
4	DX 1 Control 1	0
5	DX 1 Control 2	0
6	DX 1 Control 3	0
7	DX 1 Control 4	0
8	DX 1 Control 5	0
9	DX 1 Control 6	0

10	DX 1 Control 7	0
11	DX 1 Control 8	0
12	DX 2 Control 1	0
13	DX 2 Control 2	0
14	DX 2 Control 3	0
15	DX 2 Control 4	0
16	DX 2 Control 5	0
17	DX 2 Control 6	0
18	DX 2 Control 7	0
19	DX 2 Control 8	0
20	DX 3 Control 1	0
21	DX 3 Control 2	0
22	DX 3 Control 3	0
23	DX 3 Control 4	0
24	DX 3 Control 5	0
25	DX 3 Control 6	0
26	DX 3 Control 7	0
27	DX 3 Control 8	0

### Analog Inputs

The following table lists Analog Inputs (Object 30). It is important to note that Analog Inputs, Analog Output Control Blocks, and Analog Output Statuses are transmitted through DNP as signed numbers.  
**Note:** Points 16-31 are used for DX 2 and DX 3 on units that **DO NOT** support D-Wire. For units that do support D-Wire, only 1 DX is supported (points 8), and points 16-31 are reserved for D-Wire.

<b>Analog Inputs</b>			
Static Variation: Obj 30 Var 03 - 32-Bit analog w/o flag			
Request function codes supported: 1 (read)			
Point ID	Description	Default Unit	Class
0	Analog Channel 1	Voltage (VDC)	0
1	Analog Channel 2	Voltage (VDC)	0
2	Analog Channel 3	Voltage (VDC)	0
3	Analog Channel 4	Voltage (VDC)	0
4	Analog Channel 5	Voltage (VDC)	0
5	Analog Channel 6	Voltage (VDC)	0
6	Analog Channel 7	Voltage (VDC)	0

7	Analog Channel 8	Voltage (VDC)	0
8	DX 1 Analog Channel 1	Voltage (VDC)	0
9	DX 1 Analog Channel 2	Voltage (VDC)	0
10	DX 1 Analog Channel 3	Voltage (VDC)	0
11	DX 1 Analog Channel 4	Voltage (VDC)	0
12	DX 1 Analog Channel 5	Voltage (VDC)	0
13	DX 1 Analog Channel 6	Voltage (VDC)	0
14	DX 1 Analog Channel 7	Voltage (VDC)	0
15	DX 1 Analog Channel 8	Voltage (VDC)	0
16	DX 2 Analog Channel 1 (or D-Wire 1 for unit with D-Wire support)	Voltage (VDC)	0
17	DX 2 Analog Channel 2 (or D-Wire 2 for unit with D-Wire support)	Voltage (VDC)	0
18	DX 2 Analog Channel 3 (or D-Wire 3 for unit with D-Wire support)	Voltage (VDC)	0
19	DX 2 Analog Channel 4 (or D-Wire 4 for unit with D-Wire support)	Voltage (VDC)	0
20	DX 2 Analog Channel 5 (or D-Wire 5 for unit with D-Wire support)	Voltage (VDC)	0
21	DX 2 Analog Channel 6 (or D-Wire 6 for unit with D-Wire support)	Voltage (VDC)	0
22	DX 2 Analog Channel 7 (or D-Wire 7 for unit with D-Wire support)	Voltage (VDC)	0
23	DX 2 Analog Channel 8 (or D-Wire 8 for unit with D-Wire support)	Voltage (VDC)	0
24	DX 3 Analog Channel 1 (or D-Wire 9 for unit with D-Wire support)	Voltage (VDC)	0
25	DX 3 Analog Channel 2 (or D-Wire 10 for unit with D-Wire support)	Voltage (VDC)	0
26	DX 3 Analog Channel 3 (or D-Wire 11 for unit with D-Wire support)	Voltage (VDC)	0
27	DX 3 Analog Channel 4 (or D-Wire 12 for unit with D-Wire support)	Voltage (VDC)	0

28	DX 3 Analog Channel 5 (or D-Wire 13 for unit with D-Wire support)	Voltage (VDC)	0
29	DX 3 Analog Channel 6 (or D-Wire 14 for unit with D-Wire support)	Voltage (VDC)	0
30	DX 3 Analog Channel 7 (or D-Wire 15 for unit with D-Wire support)	Voltage (VDC)	0
31	DX 3 Analog Channel 8 (or D-Wire 16 for unit with D-Wire support)	Voltage (VDC)	0

### **Analog Change Event**

Obj 32 Var 01 - 32-Bit Analog Change Event Without Time  
Class 2 Response

Will report only when an Analog value has crossed a threshold.

## 15 Frequently Asked Questions

Here are answers to some common questions from NetGuardian users. The latest FAQs can be found on the NetGuardian support web page, <http://www.dpstelecom.com>.

If you have a question about the NetGuardian, please call us at (559) 454-1600 or e-mail us at [support@dpstele.com](mailto:support@dpstele.com)

### 15.1 General FAQs

**Q. How do I telnet to the NetGuardian?**

**A.** You must use **Port 2002** to connect to the NetGuardian. Configure your Telnet client to connect using TCP/IP (not "Telnet," or any other port options). For connection information, enter the IP address of the NetGuardian and Port 2002. For example, to connect to the NetGuardian using the standard Windows Telnet client, click Start, click Run, and type "telnet <NetGuardian IP address> 2002."

**Q. How do I connect my NetGuardian to the LAN?**

**A.** To connect your NetGuardian to your LAN, you need to configure the unit IP address, the subnet mask and the default gateway. A sample configuration could look like this:

**Unit Address:** 192.168.1.100

**subnet mask:** 255.255.255.0

**Default Gateway:** 192.168.1.1

Save your changes by writing to NVRAM and reboot. Any change to the NetGuardian's IP configuration requires a reboot.

**Q. When I connect to the NetGuardian through the craft port on the front panel it either doesn't work right or it doesn't work at all. What's going on?**

**A.** Make sure your using the right COM port settings. Your COM port settings should read:

**Bits per second:** 9600 (9600 baud)

**Data bits:** 8

**Parity:** None

**Stop bits:** 1

**Flow control:** None

**Important!** Flow control **must** be set to **none**. Flow control normally defaults to hardware in most terminal programs, and this will not work correctly with the NetGuardian.

**Q. I can't change the craft port baud rate.**

**A.** If you select a higher baud rate, you must set your terminal emulator program to the new baud rate, press Enter, and type in your password. If your terminal emulator is set to a slower baud rate than the craft port, normal keys can appear as a break key — and the craft port interprets a break key as an override that resets the baud rate to the standard 9600 baud.

**Q. How do I use the NetGuardian to access TTY interfaces on remote site equipment?**

**A.** If your remote site device supports RS-232, you can connect it to one of the eight data ports located on the NetGuardian back panel. To make the data port accessible via LAN, configure the port for TCP/IP operation. You now have a LAN-based proxy port connection that lets you access your device's TTY interface through a Telnet session.

**Q. I just changed the port settings for one of my data ports, but the changes did not seem to take effect even after I wrote the NVRAM.**

**A.** In order for data port and craft port changes (including changes to the baud rate and word format) to take

effect, the NetGuardian must be rebooted. Whenever you make changes, remember to write them to the NetGuardian's NVRAM so they will be saved when the unit is rebooted.

**Q. The LAN link LED is green on my NetGuardian, but I can't poll it from my T/Mon.**

**A.** Some routers will not forward packets to an IP address until the MAC address of the destination device has been registered on the router's Address Resolution Protocol (ARP) table. Enter the IP address of your gateway and your T/Mon system to the ARP table.

**Q. What do the terms "port," "address," "display" and "alarm point" mean?**

**A.** These terms refer to numbers that designate the location of a network alarm, from the most general (a port to which several devices are connected) to the most specific (an individual alarm sensor).

**Port:** A number designating a serial port through which a monitoring device collects data.

**Address:** A number designating a device connected to a port.

**Display:** A number designating a logical group of 64 alarm points.

**Alarm Point:** A number designating a contact closure that is activated when an alarm condition occurs. For example, an alarm point might represent a low oil sensor in a generator or an open/close sensor in a door. These terms originally referred only to physical things: actual ports, devices, and contact closures. For the sake of consistency, port-address-display-alarm point terminology has been extended to include purely logical elements: for example, the NetGuardian reports internal alarms on Port 99, Address 1.

**Q. What characteristics of an alarm point can be configured through software? For instance, can point 4 be used to sense an active-low signal, or point 5 to sense a level or a edge?**

**A.** The NetGuardian's standard configuration is for all alarm points to be level-sensed. You **cannot** use configuration software to convert alarm points to TTL (edge-sensed) operation. TTL alarm points are a hardware option that must be specified when you order your NetGuardian. Ordering TTL points for your NetGuardian does not add to the cost of the unit. What you can do with the configuration software is change any alarm point from "Normal" to "Reversed" operation. Switching to Reversed operation has different effects, depending on the kind of input connected to the alarm point:

- **If the alarm input generates an active-high signal**, switching to Reversed operation means the NetGuardian will declare an alarm in the absence of the active-high signal, creating the practical equivalent of an active-low alarm.
- **If the alarm input generates an active-low signal**, switching to Reversed operation means the NetGuardian will declare an alarm in the absence of the active-low signal, creating the practical equivalent of an active-high alarm.
- **If the alarm input is normally open**, switching to Reversed operation converts it to a normally closed alarm point.
- **If the alarm input is normally closed**, switching to Reversed operation converts it to a normally open alarm point.

**Q. Every time my NetGuardian starts up, I have to reenter the date and time. How can I get the NetGuardian to automatically maintain the date and time setting?**

**A.** You have three options for keeping the correct time on your NetGuardian:

**Real Time Clock Option:** You can order your NetGuardian with the Real Time Clock hardware option. Once it's set, the Real Time Clock will keep the correct date and time, regardless of reboots.

**Network Time Protocol Synchronization:** If your NetGuardian has Firmware Version 2.9F or later, you can configure the unit to automatically synchronize to a Network Time Protocol (NTP) server.

- To get the latest NetGuardian firmware, sign in to MyDPS at [www.dpstelecom.com/mydps](http://www.dpstelecom.com/mydps).
- For instructions on configuring your NetGuardian to use NTP synchronization, see the "Network Time Protocol Support" section of this manual.

**T/Mon RTU Time Sync Signal:** You can configure your T/Mon NOC to send an RTU Time Sync signal at a regular interval, which you can set to any time period between 10 and 10,080 minutes. The Time Sync will automatically synchronize the NetGuardian's clock to the T/Mon's clock. And if you set your T/Mon to NTP

synchronization, you'll make sure you have consistent, accurate time stamps throughout your monitoring network.

**Q. How do I back up my NetGuardian configuration?**

**A. Use FTP**

You can use File Transfer Protocol (FTP) to read and write configuration files to the NetGuardian's NVRAM, but you can't use FTP to edit configuration files.

## 15.2 SNMP FAQs

- Q. How do I configure the NetGuardian to send traps to an SNMP manager? Is there a separate MIB for the NetGuardian? How many SNMP managers can the agent send traps to? And how do I set the IP address of the SNMP manager and the community string to be used when sending traps?**
- A. The NetGuardian begins sending traps as soon as the SNMP managers are defined. The NetGuardian MIB is included on the NetGuardian Resource CD. The MIB should be compiled on your SNMP manager. (**Note:** MIB versions may change in the future.) The unit supports 2 SNMP managers, which are configured by entering its IP address in the Trap Address field of Ethernet Port Setup. You can also configure up to eight secondary SNMP managers, which is configured by selecting the secondary SNMP managers as pager recipients. Community strings are configured globally for all SNMP managers. To configure the community strings, choose System from the Edit menu, and enter appropriate values in the Get, Set, and Trap fields.
- Q. Does the NetGuardian support MIB-2 and/or any other standard MIBs?**
- A. The NetGuardian supports the bulk of MIB-2.
- Q. Does the NetGuardian SNMP agent support both NetGuardian and T/MonXM variables?**
- A. The NetGuardian SNMP agent manages an embedded MIB that supports only the NetGuardian's RTU variables. The T/MonXM variables are included in the distributed MIB only to provide SNMP managers with a single MIB for all DPS Telecom products.
- Q. How many traps are triggered when a single point is set or cleared? The MIB defines traps like "major alarm set/cleared," "RTU point set," and a lot of granular traps, which could imply that more than one trap is sent when a change of state occurs on one point.**
- A. Generally, a single change of state generates a single trap, but there are two exceptions to this rule. Exception 1: the first alarm in an "all clear" condition generates an additional "summary point set" trap. Exception 2: the final clear alarm that triggers an "all clear" condition generates an additional "summary point clear" trap.
- Q. What does "point map" mean?**
- A. A point map is a single MIB leaf that presents the current status of a 64-alarm-point display in an ASCII-readable form, where a "." represents a clear and an "x" represents an alarm.
- Q. The NetGuardian manual talks about eight control relay outputs. How do I control these from my SNMP manager?**
- A. The control relays are operated by issuing the appropriate set commands, which are contained in the DPS control grid. For more information about the set commands, see Appendix, "Display Mapping," in any of the NetGuardian software configuration guides.
- Q. How can I associate descriptive information with a point for the RTU granular traps?**
- A. The NetGuardian alarm point descriptions are individually defined using the Web Browser or TTY interfaces.
- Q. My SNMP traps aren't getting through. What should I try?**
- A. Try these three steps:
1. Make sure that the Trap Address (IP address of the SNMP manager) is defined. (If you changed the Trap Address, make sure you saved the change to NVRAM and rebooted.)
  2. Make sure all alarm points are configured to send SNMP traps.
  3. Make sure the NetGuardian and the SNMP manager are both on the network. Use the NetGuardian's ping command to ping the SNMP manager.

## 15.3 Pager FAQs

### Q. Why won't my alpha pager work?

- A. To configure the NetGuardian to send alarm notifications to an alpha pager, enter the **data** phone number for your pager in the Phone Number field. This phone number should connect to your pager service's modem. Then enter the PIN for your pager in the PIN/Rcpt/Port field. You don't need to enter anything in any of the other fields. If you still don't receive pages, try setting the Dial Modem Init string to AT\$37=9. This will limit the NetGuardian's connection speed. Be sure to use the rpt debug feature, if needed.

### Q. Numeric pages don't come in or are cut off in the middle of the message. What's wrong?

- A. You need to set a delay between the time the NetGuardian dials your pager number and the time the NetGuardian begins sending the page message. You can set the delay in the Pager Number field, where you enter your pager number. First enter the pager number, then enter some commas directly after the number. Each comma represents a two-second delay. So, for example, if you wanted an eight-second delay, you would enter "555-1212,,," in the Pager Number field.

### Q. What do I need to do to set up e-mail notifications?

- A. You need to assign the NetGuardian an e-mail address and list the addresses of e-mail recipients. Let's explain some terminology. An e-mail address consists of two parts, the user name (everything before the "@" sign) and the domain (everything after the "@" sign). To assign the NetGuardian an e-mail address, choose System from the Edit menu. Enter the NetGuardian's user name in the Name field (it can't include any spaces) and the domain in the Location field. For example, if the system configuration reads:

Name: netguardian

Location: proactive.com

Then e-mail notifications from the NetGuardian will be sent from the address "netguardian@proactive.com." The next step is to list the e-mail recipients. Choose Pagers from the Edit menu. For each e-mail recipient, enter his or her e-mail domain in the Phone/Domain field and his or her user name in the PIN/Rcpt/Port field. You must also enter the IP address of an SMTP server in the IPA field and configure the alarm point to use the pager you setup as email.

## 16 Technical Support

DPS Telecom products are backed by our courteous, friendly Technical Support representatives, who will give you the best in fast and accurate customer service. To help us help you better, please take the following steps before calling Technical Support:

**1. Check the DPS Telecom website.**

You will find answers to many common questions on the DPS Telecom website, at <http://www.dpstelecom.com/support/>. Look here first for a fast solution to your problem.

**2. Prepare relevant information.**

Having important information about your DPS Telecom product in hand when you call will greatly reduce the time it takes to answer your questions. If you do not have all of the information when you call, our Technical Support representatives can assist you in gathering it. Please write the information down for easy access. Please have your user manual and hardware serial number ready.

**3. Have access to troubled equipment.**

Please be at or near your equipment when you call DPS Telecom Technical Support. This will help us solve your problem more efficiently.

**4. Call during Customer Support hours.**

Customer support hours are Monday through Friday, from 7 A.M. to 6 P.M., Pacific time. The DPS Telecom Technical Support phone number is **(559) 454-1600**.

**Emergency Assistance:** *Emergency assistance is available 24 hours a day, 7 days a week. For emergency assistance after hours, allow the phone to ring until it is answered with a paging message. You will be asked to enter your phone number. An on-call technical support representative will return your call as soon as possible.*

## 17 End User lisenche Agreement

All Software and firmware used in, for, or in connection with the Product, parts, subsystems, or derivatives thereof, in whatever form, including, without limitation, source code, object code and microcode, including any computer programs and any documentation relating to or describing such Software is furnished to the End User only under a non-exclusive perpetual license solely for End User's use with the Product.

The Software may not be copied or modified, in whole or in part, for any purpose whatsoever. The Software may not be reverse engineered, compiled, or disassembled. No title to or ownership of the Software or any of its parts is transferred to the End User. Title to all patents, copyrights, trade secrets, and any other applicable rights shall remain with the DPS Telecom.

DPS Telecom's warranty and limitation on its liability for the Software is as described in the warranty information provided to End User in the Product Manual.

End User shall indemnify DPS Telecom and hold it harmless for and against any and all claims, damages, losses, costs, expenses, obligations, liabilities, fees and costs and all amounts paid in settlement of any claim, action or suit which may be asserted against DPS Telecom which arise out of or are related to the non-fulfillment of any covenant or obligation of End User in connection with this Agreement.

This Agreement shall be construed and enforced in accordance with the laws of the State of California, without regard to choice of law principles and excluding the provisions of the UN Convention on Contracts for the International Sale of Goods. Any dispute arising out of the Agreement shall be commenced and maintained only in Fresno County, California. In the event suit is brought or an attorney is retained by any party to this Agreement to seek interpretation or construction of any term or provision of this Agreement, to enforce the terms of this Agreement, to collect any money due, or to obtain any money damages or equitable relief for breach, the prevailing party shall be entitled to recover, in addition to any other available remedy, reimbursement for reasonable attorneys' fees, court costs, costs of investigation, and other related expenses.
